Affiant Sarah Shenstone-Harris, being first duly sworn, states the following: The prepared Direct Testimony and associated exhibits filed herewith on Friday, March 10, 2023, constitute the direct testimony of Affiant in the above-captioned case. Affiant states that she would give the answers set forth in her Direct Testimony if asked the questions propounded therein. Affiant further states that, to the best of her knowledge, her statements made are true and correct.

1 **1. INTRODUCTION AND SUMMARY**

2 **Q Please state your name and occupation.**

3 **A** My name is Sarah Shenstone-Harris. I am a Senior Associate at Synapse Energy  
4 Economics, Inc. (“Synapse”). My business address is 485 Massachusetts Avenue,  
5 Suite 3, Cambridge, Massachusetts 02139.

6 **Q Please describe Synapse Energy Economics.**

7 **A** Synapse is a research and consulting firm specializing in energy and  
8 environmental issues, including electric generation, transmission and distribution  
9 system reliability, ratemaking and rate design, electric industry restructuring and  
10 market power, electricity market prices, stranded costs, efficiency, renewable  
11 energy, environmental quality, and nuclear power.

12 Synapse’s clients include state consumer advocates, public utilities commission  
13 staff, attorneys general, environmental organizations, federal government  
14 agencies, and utilities.

15 **Q Please summarize your work experience and educational background.**

16 **A** I provide research, analysis, and consulting services on various electricity-sector  
17 issues, including integrated resource planning and clean energy project  
18 evaluation. Prior to joining Synapse, I worked at Reading Municipal Light  
19 Department, one of Massachusetts’s largest municipally owned utilities, as an  
20 Integrated Resource Analyst. I helped manage Reading Light’s energy portfolio  
21 and secured reliable and cost-competitive long-term power contracts. I led the rate  
22 increase process and the design of new rate structures, such as a residential  
23 electric vehicle (“EV”) time-of-use rate. I was also involved in the administration  
24 and development of numerous energy efficiency and electrification programs,

1 including incentive programs for air-source heat pumps and EV chargers, among  
2 others.

3 I received a Master of Science in Environmental Sustainability from the  
4 University of Ottawa's Institute for the Environment, as well as a Bachelor of  
5 Science in Biology from Queen's University in Kingston, Ontario, Canada.

6 A copy of my current resume is attached as Exhibit SSH-1.

7 **Q On whose behalf are you testifying in this case?**

8 **A** I am testifying on behalf of Sierra Club.

9 **Q Have you testified previously before the Kentucky Public Service  
10 Commission ("Commission")?**

11 **A** No.

12 **Q What is the purpose of your testimony in this proceeding?**

13 **A** I review Duke Energy Kentucky's ("Company" or "DEK") proposal to update  
14 East Bend Generating Station's ("East Bend") depreciation schedule. I evaluate  
15 East Bend's recent historical economic performance and its likely economic  
16 performance going forward. I provide recommendations for East Bend's  
17 retirement date and for DEK to evaluate the use of depreciation financing to  
18 minimize risks and costs for ratepayers. Additionally, I review the Company's  
19 proposed rate increases and evaluate their potential impact on EV adoption.

20 **Q How is your testimony structured?**

21 **A** In Section 2, I summarize my findings and recommendations for the Commission.

1 In Section 3, I describe East Bend and discuss DEK’s selection of East Bend’s  
2 2035 retirement date. I recommend DEK retire the plant by 2030, at the latest.

3 In Section 4, I review East Bend’s historical and future economic performance  
4 based on the Company’s own data. I evaluate the assumptions DEK relied on in  
5 its own assessment of East Bend’s future performance. I outline costs DEK can  
6 avoid if it retires East Bend and replaces it with alternatives. I also summarize the  
7 risks DEK is subjecting ratepayers to by continuing to operate a generation fleet  
8 that is so heavily reliant on coal.

9 In Section 5, I discuss ratepayer-backed securitization and other tools available to  
10 DEK to mitigate potential rate shock impacts associated with the early retirement  
11 of East Bend.

12 In Section 6, I review the proposed changes to the Residential Time-of-Use  
13 Critical Peak Pricing Rate (“Rate RS-TOU-CPP”), the Time-of-Day Rate for  
14 Service at Distribution Voltage (“Rate DT”), and the Load Management Rider  
15 (“Rider LM”). I evaluate the impact of these rates on customer bills and  
16 demonstrate that these proposed changes undermine DEK’s stated intent of  
17 increasing EV adoption and directing charging load to periods of low demand.

18 **Q What documents did you rely on for your analysis, findings, and**  
19 **observations?**

20 **A** My analysis relies primarily on the workpapers, exhibits, and discovery responses  
21 of Duke Energy witnesses in this proceeding. I also rely on public information  
22 from other Kentucky Public Service Commission proceedings and other publicly  
23 available documents.

1   **2. FINDINGS AND RECOMMENDATIONS**

2   **Q     Please summarize your findings.**

3   **A     My primary findings are:**

- 4           1. Between 2018 and 2021, East Bend incurred costs in excess of its market  
5           energy revenue and capacity value. These excess costs have been passed  
6           on to DEK ratepayers.
- 7           2. DEK has not demonstrated the prudence of continuing to invest in and  
8           operate East Bend through to its current retirement date. My analysis  
9           shows that East Bend is not expected to be economic going forward, under  
10          reasonable assumptions about the future, and that ratepayers would likely  
11          be better off retiring the plant by 2030.
- 12          3. DEK and its ratepayers can avoid capital expenditures and operations and  
13          maintenance (“O&M”) costs and mitigate the risks associated with relying  
14          heavily on coal by retiring East Bend earlier than 2035.
- 15          4. The Company’s projections of the future costs required to operate and  
16          maintain East Bend are unrealistically low and lack transparency.
- 17          5. The analysis that Duke used to support its ongoing operation of East Bend  
18          is at minimum two years old, and it relies on outdated assumptions that  
19          pre-date the federal Inflation Reduction Act (“IRA”) and current market  
20          conditions.
- 21          6. There are alternative financing mechanisms available to DEK that would  
22          enable the Company to recover the value of East Bend, while avoiding  
23          rate shocks to customers that could result from an early retirement.

1                   7. The proposed changes to Rider LM and Rate DT will result in EV  
2                   customers paying more than their fair share of costs for off-peak charging  
3                   and will reduce incentives to shift load to off-peak hours, resulting in less  
4                   efficient use of the grid.

5   **Q     Please summarize your recommendations.**

6   **A     Based on my findings, I recommend the following:**

- 7                   1. Duke Energy should commit to retiring East Bend by 2030 to reduce costs  
8                   and avoid risks for DEK ratepayers.
- 9                   2. Before any other future rate cases, fuel dockets, or other regulatory  
10                  proceedings involving any of DEK’s generating assets, the Commission  
11                  should require DEK to conduct more appropriate and accurate electricity  
12                  system modeling and forecasting of East Bend’s economic and operational  
13                  performance.
- 14                 3. The Commission should require DEK to provide more clear and consistent  
15                  accounting of historical and projected future costs associated with  
16                  operating East Bend including variable O&M, fixed O&M, and sustaining  
17                  capital expenditures.
- 18                 4. The Commission should order the Company, as part of its next Integrated  
19                  Resource Plan (“IRP”), to evaluate the economics of retiring the plant  
20                  early (2030 or 2035) and using securitization to finance the remaining  
21                  balance. This would minimize the rate shock to customers while still  
22                  allowing DEK to recover the capital it invested in the plant.
- 23                 5. To encourage transportation electrification and maximize benefits for all  
24                  customers, the Commission should require the Company to maintain the  
25                  use of time-varying volumetric rates for the recovery of distribution costs

1 for Rate DT, rather than shifting these costs to a non-coincident demand  
2 charge. The Commission should also reject the changes to Rider LM, and  
3 only apply demand charges to on-peak hours.

4 **3. DUKE ENERGY KENTUCKY PLANS TO RETIRE EAST BEND IN 2035 AND SEEKS TO**  
5 **ALIGN ITS DEPRECIATION SCHEDULE TO THIS RETIREMENT DATE**

6 ***i. DEK plans on retiring East Bend in 2035 and seeks to align its depreciation***  
7 ***schedule to this new date***

8 **Q What is Duke Energy requesting in this docket relating to East Bend?**

9 **A** Duke Energy is requesting approval to align East Bend’s depreciation schedule  
10 with its planned retirement date of 2035.<sup>1</sup>

11 **Q What is the application test-year?**

12 **A** The application test-year is the future 12-month period from July 1, 2023, to June  
13 30, 2024.<sup>2</sup>

14 **Q Please provide an overview of Duke Energy’s East Bend Generating Station.**

15 **A** East Bend Generating Station is a 600 MW (net summer rating) coal-fired  
16 generator located along the Ohio River, in Boone County, KY.<sup>3</sup> Duke Energy

---

<sup>1</sup> Direct testimony of Amy B. Spiller, pg. 28-29.

<sup>2</sup> *Ibid.*

<sup>3</sup> Direct testimony of William Luke, pg. 3.

1 Kentucky is the sole owner of the plant.<sup>4</sup> The plant was commissioned in 1981<sup>5</sup>  
2 and is currently 42 years old.

3 **Q What is the undepreciated balance of East Bend as of 2022?**

4 **A** East Bend still has an undepreciated balance of roughly \$570 million.<sup>6</sup>

5 **Q What was Duke Energy's assumed retirement plan for East Bend in the last**  
6 **rate case?**

7 **A** In the Company's last rate case, East Bend was assumed to have a retirement date  
8 of 2041.

9 **Q Why does DEK say it is seeking to accelerate the retirement of East Bend**  
10 **from 2041 to 2035?**

11 **A** DEK cites mounting costs, increasing adoption of renewables, and market  
12 changes that reduce the coal plant's dispatchability as factors driving the  
13 acceleration of the retirement date of East Bend.<sup>7</sup>

<sup>5</sup> Direct testimony of Duke Energy witness William Luke, pg. 3.

<sup>6</sup> DEK response to Kroger request 1-5 Attachment.

<sup>7</sup> Direct Testimony of Scott Park, pg. 8-9.

1        **ii. DEK modeling supports a retirement date for East Bend of no later than 2035,**  
2        **if not earlier**

3        **Q        What is the most recent analysis conducted by DEK to support its proposed**  
4        **retirement plan and depreciation schedule for East Bend?**

5        **A        The Company's 2021 IRP is the most recent analysis and modeling DEK has**  
6        **done to support the proposed 2035 retirement date for East Bend.<sup>8</sup>**

7        **Q        Provide an overview of the modeling conducted for the 2021 IRP.**

8        **A        In its most recent IRP, DEK modeled scenarios both with and without a carbon**  
9        **price. The Company tested low, base, and high gas price sensitivities for scenarios**  
10       **both with and without a carbon price. DEK selected a Carbon Regulation scenario**  
11       **for its base case.<sup>9</sup> These scenarios informed selection of the 2021 IRP Portfolio,**  
12       **which plans for an East Bend retirement in 2035.**

13       **Q        Why is DEK assuming a future with carbon regulation in its IRP baseline**  
14       **scenario? Is it because the Company believes that carbon regulation is likely?**

15       **A        DEK states that a future with carbon regulation is likely over the 15-year planning**  
16       **period with no major disruptions to the business environment.<sup>10</sup> For the sake of**  
17       **modeling, the Company assumes a \$5 per ton price on carbon starting in 2025 and**  
18       **increasing by \$5 per ton each year thereafter.<sup>11</sup> This is analogous to a mass CO<sub>2</sub>**  
19       **cap or a cap-and-trade program.<sup>12</sup>**

---

<sup>8</sup> DEK response to Sierra Club request 1-7.

<sup>9</sup> Duke Energy Kentucky. 2021 Integrated Resource Plan, pg. 12.

<sup>10</sup> *Ibid.*

<sup>11</sup> Duke Energy Kentucky. 2021 Integrated Resource Plan, pg. 30.

<sup>12</sup> *Ibid.*

1 No one can say for certain whether there will be a price on carbon, a cap-and-  
2 trade program, or a mass CO<sub>2</sub> cap at any point in the next 15 years. But based on  
3 current trends, most experts in the industry agree that there will be greater  
4 regulation for coal-fired power plants in general over this timeframe. A carbon  
5 price can serve as a proxy for any type of regulation which will increase the cost  
6 to operate a coal-fired power plant and continue to make renewables and clean  
7 energy resources less costly economic alternatives.

8 Relative to other energy resource types, coal-fired power plants have numerous  
9 environmental compliance costs and regulatory risks. These include (1) carbon  
10 emissions, (2) air emissions (e.g., particulate matter), (3) water emissions (e.g.,  
11 wastewater), (4) by-products and waste (e.g., coal ash), and (5) plant inputs (e.g.,  
12 coal mining). The risk of future regulation touching on at least one, or even more  
13 than one, of these inputs and outputs is almost inevitable. Increased regulation of  
14 fossil fuels, whether that be carbon or otherwise, is highly probable.

15 **Q What does DEK find regarding East Bend’s retirement in its most recent**  
16 **IRP analysis?**

17 **A** In DEK’s IRP base case modeling (which assumes carbon regulation with base  
18 gas prices), the Company finds that East Bend will be economically retired in  
19 2027.<sup>13</sup> DEK also modeled a future without carbon regulation; in that scenario  
20 East Bend continues to operate economically until the end of its useful life.

21 While the 2021 IRP portfolio set East Bend’s anticipated retirement date at 2035,  
22 the 2021 IRP modeling does not suggest 2035 as a specific retirement date for  
23 East Bend—in fact, it recommends an earlier date. IRP analysis suggests 2027 is  
24 the most economic retirement date for East Bend, according to its base case

---

<sup>13</sup> Duke Energy Kentucky. 2021 Integrated Resource Plan, pg. 42-46.

1 modeling.<sup>14</sup> DEK's proposal for a 2035 retirement date appears to be based on the  
2 Company's assessment that the plant is generally becoming more uneconomic to  
3 operate.<sup>15</sup>

4 **Q What has changed since DEK completed its most recent IRP analysis?**

5 **A** There have been many changes in the market since DEK completed its 2021 IRP.  
6 First, Congress passed the federal IRA in August 2022, which provides tax  
7 benefits for wind, solar, and battery storage, as well as other provisions that  
8 support the adoption of clean energy sources. The IRA will put downward  
9 pressure on the price of renewable energy and increase renewable energy's  
10 penetration on the grid. As a result, East Bend and other aging fossil fuel plants  
11 will have a harder time competing in the energy market, which will impact their  
12 economics.

13 Second, there has been more gas price volatility and higher regional coal prices as  
14 a result of global energy market changes that stemmed from the war in Ukraine.  
15 This has not only impacted the fuel costs for fossil fuel plants; it has also driven  
16 up energy prices across the region. This type of fuel volatility is inherent to  
17 systems that rely heavily on gas and coal plants.

18 Third, the country has experienced inflation and supply chain challenges. This has  
19 driven up prices across numerous industries, including the energy industry. This  
20 both impacts the cost of new resources and increases the cost to operate and  
21 maintain existing resources like East Bend, especially if additional environmental  
22 capital costs are required.

---

<sup>14</sup> Duke Energy Kentucky. 2021 Integrated Resource Plan, pg. 42.

<sup>15</sup> See, e.g., Direct testimony of Scott Park, pg. 10.

1 The Company has not yet performed any detailed analysis of the impact of any of  
2 these forces on its long-term resource plan.<sup>16</sup>

3 **Q Do these market changes mean that DEK should retire East Bend earlier**  
4 **than 2035?**

5 **A** Yes. The changing market dynamics seen within the last two years will have a  
6 material impact on East Bend’s economics.<sup>17</sup> In fact, Company Witness Park  
7 states in his direct testimony that, in light of market changes, “the retirement of  
8 East Bend is more likely to be sooner than 2035 rather than later.”<sup>18</sup>

9 Unfortunately, DEK has not updated its modeling to incorporate these market  
10 shifts already underway.<sup>19</sup> As I will show in my analyses, DEK assumptions and  
11 analysis are no longer up to date, and they paint an inaccurate picture of the  
12 future. Updated DEK modeling would likely support a retirement date earlier than  
13 2035. In light of recent federal policy changes, as well as shifting market  
14 dynamics, my analysis shows that DEK should commit to retiring East Bend by  
15 2030.

16 **Q Why do you propose retiring East Bend by at least 2030?**

17 **A** The Company has presented no evidence that keeping the plant online beyond  
18 2030 is the lowest cost option. Based on all data provided by DEK, retiring East  
19 Bend by 2030 and replacing it with alternatives likely provides the lowest cost  
20 and lowest risk option for ratepayers. This date will allow DEK sufficient time to

---

<sup>16</sup> DEK response to Sierra Club request 1-23.

<sup>17</sup> Direct testimony of William Luke, pg. 12.

<sup>18</sup> Direct testimony of Scott Park, pg. 10.

<sup>19</sup> DEK response to Sierra Club request 1-7.

1 build or procure replacement resources while also reducing how long East Bend  
2 operates beyond when it is providing economic benefits to ratepayers.

3 **Q Early retirement can cause rate shocks to customers. Are there options to**  
4 **mitigate rate impacts as a result of early retirement?**

5 **A** I recognize the concern that if the depreciation schedule is advanced to 2030 or  
6 earlier, customer rates could increase. Likewise, if East Bend is converted to a  
7 regulatory asset, customers in the future could be asked to continue to pay  
8 depreciation expenses, while also paying for replacement energy. But there are  
9 ways to minimize these barriers and cost impacts to ratepayers, such as ratepayer-  
10 backed securitization or regulatory assets without a return on equity allowed. I  
11 explore the options of securitization in greater detail in Section 6 below, and I  
12 recommend the Commission order the Company to evaluate the economics of  
13 using the tool to minimize ratepayer impacts of early retirement of East Bend.

14 Additionally, retiring East Bend early will protect ratepayers against numerous  
15 other rate increases, from ongoing O&M and sustaining capital costs (which can  
16 be expected to increase as the plant ages) to volatile fuel costs, as well as  
17 replacement energy during forced outages. I discuss these avoided risks and costs  
18 in more detail in Section 4(iii) below.

1 **4. DEK HAS NOT DEMONSTRATED THE PRUDENCE OF CONTINUING TO INVEST IN AND**  
2 **OPERATE EAST BEND THROUGH TO ITS CURRENT RETIREMENT DATE OF 2035**

3 ***i. DEK's East Bend costs have exceeded its revenue and value in recent years***

4 **Q Describe East Bend's historical utilization rate.**

5 **A** Between 2018 and 2021, East Bend's utilization rate ranged from 43 percent to 60  
6 percent<sup>20</sup> (as seen in Figure 3, below).

7 **Q Describe East Bend's financial performance in recent historical years.**

8 **A** Based on the Company's own data, I find that East Bend incurred costs in excess  
9 of its market energy and capacity value each year from 2018 to 2020, and broke  
10 even in 2021 (Figure 1). These costs have been passed on to DEK ratepayers.

11 **Figure 1. East Bend historical costs and revenues**

12  
13

Source: see description in text.

<sup>20</sup> Calculated using East Bend's net summer capacity and generation data from U.S. Energy Information Administration Form 923.

1 The exception was the outlier year of 2022 where, as can be seen above in Figure  
 2 1, East Bend’s generation revenues were particularly high. Although average  
 3 generation was roughly the same as previous years, locational marginal prices  
 4 (“LMP”) were unusually high for much of 2022 (Figure 2). This was due to a  
 5 variety of global factors, most notably the war in Ukraine, which increased gas  
 6 and energy market prices. These high LMP prices were responsible for uniquely  
 7 high generation revenue in that year and should be viewed as an anomaly.

8 **Figure 2. PJM hourly day-ahead (DA) and real-time (RT) locational marginal prices**  
 9 **(LMP) for the East Bend node, and East Bend generation**

10  
 11 *Source: Hourly DA and RT prices from PJM, available at <https://www.pjm.com/markets-and-operations/energy>, and East Bend generation from U.S. Energy Information Administration (“EIA”) Form 923.*  
 12  
 13

1 **Q Describe your methodology for evaluating the historical economic**  
2 **performance of East Bend.**

3 **A** I relied on data DEK provided in discovery. I summed annual historical East Bend  
4 fuel costs,<sup>21</sup> maintenance costs,<sup>22</sup> and capital expenditures<sup>23</sup> to determine total  
5 historical costs for each year. I estimated East Bend’s historical capacity value  
6 based on its unforced capacity (UCAP)<sup>24</sup> and the capacity value in PJM’s Base  
7 Residual Auction (BRA)<sup>25</sup> for each planning year. We relied on BRA as a proxy  
8 for the capacity value of East Bend, even though DEK is a fixed resource  
9 requirement (FRR) entity and does not actually participate in the PJM BRA. I  
10 summed this capacity value with East Bend’s annual energy revenues<sup>26</sup> to find the  
11 total historical value per year. I netted the annual costs and values to find East  
12 Bend’s historical net value (or cost) for each year.<sup>27</sup>

<sup>22</sup> DEK response to Kroger request 1-2(a) Attachment.

<sup>23</sup> DEK response to Kroger request 1-3(a) Attachment.

<sup>24</sup> DEK response to Sierra Club request 1-9 Confidential Attachment 1.

<sup>25</sup> Final zonal capacity prices (DEOK zone), PJM Base Residual Auction Results for  
2016-2017 Planning Year through 2022–2023 Planning Year.

<sup>26</sup> DEK response to Sierra Club request 1-14(b) Attachment.

<sup>27</sup> An alternative method for calculating capacity value is using PJM’s Net Cost of New  
Entry (CONE). The CONE values are calculated based on the cost to build a new  
natural gas-fired combustion turbine facility in PJM’s territory. Given that East Bend’s  
PJM zone, DOEK, has not been constrained in recent years, capacity can generally be  
procured for less than the cost of building an entirely new peaking plant. For this  
reason, auction prices were used to value historical capacity instead of CONE.

1        **ii. My analysis shows that East Bend is not expected to be economic going**  
2        **forward, under reasonable assumptions about the future**

3        **Q        Describe your methodology for forecasting the economic performance of**  
4        **East Bend.**

5        **A**        I evaluated East Bend’s going-forward economics using DEK data provided in  
6        discovery as well as publicly available documents. Similar to my methodology for  
7        evaluating East Bend’s historical economic performance, I summed DEK’s own  
8        annual projected fuel costs,<sup>28</sup> O&M costs,<sup>29</sup> and capital expenditures<sup>30</sup> for East  
9        Bend to determine total projected costs per year. I estimated East Bend’s capacity  
10       value based on its projected firm capacity<sup>31</sup> and both the BRA clearing prices and  
11       Net Cost of New Entry (CONE). I summed this capacity value with DEK’s annual  
12       projected energy revenues<sup>32</sup> for East Bend to find the total value per year. I netted  
13       the annual costs and values to find East Bend’s projected net value (or cost) for  
14       each year. I calculated the economic performance under both the scenario with  
15       carbon regulation and the scenario without carbon regulation, assuming base gas  
16       prices in both cases. To determine net present value (NPV), I used DEK’s  
17       weighted average cost of capital<sup>33</sup> as a discount rate.

18       My analysis is not intended to calculate East Bend’s full revenue requirements.  
19       Instead, it looks at East Bend spending relative to what it is earning, on a forward-  
20       going basis, and it identifies the costs that can be avoided for ratepayers if DEK  
21       retires East Bend ahead of 2035.

<sup>30</sup> *Ibid.*

<sup>31</sup> DEK response to Sierra Club request 2-2 Revised Confidential Attachments 2 and 5.

<sup>32</sup> DEK confidential response to Sierra Club request 2-1 Confidential attachment.

<sup>33</sup> DEK response to Commission Staff request 1-56, Attachment\_BLS-2.

1 **Q** **What factors are driving your conclusion that East Bend is not likely to**  
2 **provide economic value to ratepayers going forward?**

3 **A** As I will explain in more detail below, East Bend is not projected to be economic  
4 on a forward going basis, when using reasonable assumptions for several key  
5 variables: (1) fixed costs, (2) East Bend's utilization, (3) LMPs and market  
6 dynamics, and (4) capacity price. Using more realistic assumptions, I find that  
7 East Bend is expected to incur costs in excess of its value of between \$261  
8 million and \$154 million over the period 2023-2034.

9 **Q** **How is your analysis presented below?**

10 **A** I first discuss DEK's base case modeling, which assumes a carbon price. I review  
11 the projected capacity factor for East Bend under this scenario, and I present  
12 analysis on the plant's forward-going economics using DEK-provided data. I  
13 show this analysis using both BRA and CONE prices for capacity. I then provide  
14 a critique of DEK's assumptions of fixed costs and present analysis with more  
15 realistic fixed cost assumptions.

16 Second, I discuss DEK's modeling assuming no carbon price. I discuss DEK's  
17 very unrealistic assumptions about East Bend's capacity factor for this scenario. I  
18 also discuss DEK's outdated assumptions for LMPs and the energy market  
19 generally. I then present analysis on East Bend's forward-going economics with  
20 more realistic fixed cost assumptions. Next, I present analysis on East Bend with  
21 both more realistic fixed cost assumptions and much more realistic utilization  
22 assumptions.

23 I then provide a summary of my analysis and conclusions and offer some  
24 additional context on my methodology and DEK data.

1 **Q What does the Company project East Bend’s utilization to be in the future?**

2 **A** DEK projects utilization of East Bend will [REDACTED]

3 [REDACTED]  
4 onwards (Figure 3). These modeling results assume that a carbon price or other  
5 environmental restrictions are implemented in 2025 which increase the cost to  
6 operate fossil power plants.

7 **Figure 3. Confidential historical and projected capacity factors for East Bend**

8  
9 *Source: Historical values from U.S. Energy Information Administration Form 923. Projections*  
10 *from DEK response to Sierra Club 2-2 Confidential Attachments 2 and 5.*

11 **Q Why do you rely on DEK’s scenario with a carbon price?**

12 **A** As carbon regulations are implemented, coal plant costs will increase. East Bend  
13 will not be able to compete with low-cost renewable energy alternatives in the  
14 PJM market and will therefore be committed and dispatched less and less. This  
15 trend of decreasing utilization and increasing costs at aging coal plants does not  
16 depend on a carbon tax—as DEK witnesses acknowledge in their testimonies, the  
17 industry is already moving in this direction.

1 **Q** **What do your findings show about the future financial performance of East**  
2 **Bend, assuming a future with carbon regulation?**

3 **A** As shown in Figure 4, I find that East Bend is projected to incur net losses of  
4 \$123 million (on a NPV basis) from 2023 to 2034, or an average of \$14 million  
5 per year (2022\$) at East Bend. These results are based on valuing capacity based  
6 on PJM auction capacity prices.

7 **Figure 4. Confidential projected net revenues for East Bend, assuming carbon**  
8 **regulation and PJM BRA capacity values**

9  
10

*Source: see description in text.*

1 **Q** **What do the results look like for East Bend’s financial performance,**  
2 **assuming a future with carbon regulation but with a higher (but unlikely and**  
3 **overly conservative) capacity price?**

4 **A** I conducted a sensitivity analysis using a higher capacity price represented by the  
5 PJM’s Net CONE.<sup>34</sup> The CONE values are calculated based on the cost to build a  
6 new natural gas-fired combustion turbine in PJM’s territory.<sup>35</sup> In my opinion, this  
7 is a very unlikely estimate because unless a region’s capacity is highly  
8 constrained (i.e., all existing capacity is cleared, and a new facility is required as  
9 the marginal resource) then capacity can generally be procured for less than the  
10 cost of building an entirely new peaking plant. Furthermore, CONE is the value  
11 for the plant’s first year of operation; it would be highly unlikely that one would  
12 need to build a new plant each year. Therefore, applying CONE to each year is  
13 very conservative. It is also unlikely that bilateral capacity sales wouldn’t be  
14 available to cover at least some of the replacement capacity.

15 I find that East Bend is projected to incur net positive revenue when using CONE  
16 to estimate capacity prices. I applied CONE starting in 2024, when DEK’s PJM  
17 zone, DEOK, was somewhat constrained in the capacity auction.<sup>36</sup> As I discussed,  
18 this is likely an unrealistically high capacity value, especially when applied to all

---

<sup>34</sup> Net CONE is defined as “the total annual net revenue (net of variable operating costs) that a new generation resource would need to recover its capital investment and fixed costs, given reasonable expectations about future recovery over its economic life.” PJM CONE 2026/2027 Report, The Brattle Group, Apr. 2022, *available at*: <https://www.pjm.com/-/media/library/reports-notice/special-reports/2022/20220422-brattle-final-cone-report.ashx>.

<sup>35</sup> *Ibid.*

<sup>36</sup> PJM 2024/2025 Base Residual Auction Report, Feb. 28, 2023, *available at* <https://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/2024-2025/2024-2025-base-residual-auction-report.ashx>.

1 years. In this case, I find that East Bend is projected to incur a net revenue of  
2 \$159 million (on a NPV basis) from 2023 to 2034.

3 **Q For DEK’s carbon regulation scenario, do you have concerns with the**  
4 **Company’s fixed costs forecast?**

5 **A** Yes. From 2023 to 2034, DEK is forecasting that East Bend will incur fixed costs  
6 at an average of [REDACTED] per year (Figure 5). With the exception of 2024,  
7 DEK assumes little variability between years. Fixed costs include maintenance  
8 capital (also known as sustaining capital costs) and fixed O&M.<sup>37</sup>

9 **Figure 5. East Bend historical capital expenditures and confidential projected fixed**  
10 **O&M and maintenance capital (combined)**

11  
12 *Source: Historical capital expenditures from DEK response to Kroger 1-3(a). Projections from*  
13 *DEK response to Sierra Club request 2-2 Confidential Attachments 2 and 5. DEK combines fixed*  
14 *O&M and maintenance capital projections.*

---

<sup>37</sup> DEK data for fixed O&M and maintenance capital were combined. DEK response to Sierra Club 2-3.

1 But projected fixed spending is (1) substantially below industry averages, (2)  
 2 unreasonably low based on historical spending, and (3) identical between  
 3 scenarios with and without carbon regulation.

4 East Bend’s average historical spending<sup>38</sup> is on par with coal plants of similar size  
 5 and age. Yet when looking at East Bend’s projected fixed costs, spending is well  
 6 below the industry average (Table 1). DEK has not explained why its projected  
 7 fixed costs are so much lower than plants of similar size and age. This  
 8 discrepancy, particularly in light of the historical similarity, indicates that the  
 9 Company is likely significantly underestimating future costs for East Bend in its  
 10 modeling.

11 **Table 1. EIA (Sargent & Lundy) industry averages and confidential East Bend**  
 12 **projected CapEx and fixed O&M costs (combined)**

	<b>CapEx and Fixed Operations &amp; Maintenance (Combined)</b>			
	<b>\$2022 \$/kW-year</b>			
<b>East Bend Future Scenario</b>	Sargent & Lundy annual estimates	Historical CapEx avg 2018–2022	Projected average 2023–2027	Projected average 2023–2034
Carbon regulation & no carbon regulation	\$71	\$77	■	■

13 *Source: DEK response to Sierra Club request I-18 confidential attachment, and U.S. EIA,*

 15 *[https://www.eia.gov/analysis/studies/powerplants/generationcost/pdf/full\\_report.pdf](https://www.eia.gov/analysis/studies/powerplants/generationcost/pdf/full_report.pdf). Sargent &*  
 16 *Lundy CapEx and fixed O&M estimates are combined. Sargent & Lundy CapEx were specific to*  
 17 *coal plants between 40 and 50 years old with flue gas desulfurization.*

18 Furthermore, when considering future environmental regulation, capital upgrades  
 19 are a near certainty. This applies especially to the carbon regulation modeling  
 20 scenario, but DEK should also have considered it to a lesser degree in the non-  
 21 regulation scenario. Plants such as East Bend with flue gas desulfurization (FGD)  
 22 are particularly cost-intensive for capital maintenance. Chemicals and reagents

---

<sup>38</sup> Historical capital expenditures (DEK response to Kroger request 1-3(a)).

1 corrode equipment such as pumps, valves, etc., and need replacement more  
2 frequently compared to plants without FGD.<sup>39</sup>

3 By under-projecting future spending in its modeling, DEK is making the plant  
4 look more economic on a forward-going basis than both its own historical data  
5 and industry standard data would suggest.

6 **Q What does your analysis show when fixed-spending assumptions are more**  
7 **realistic?**

8 **A** As I previously stated, DEK's forecasts for East Bend's fixed costs are  
9 significantly below both historical spending and industry averages. I increased the  
10 fixed costs (for 2023–2034) from DEK's projection of [REDACTED]<sup>40</sup> to DEK's  
11 own historical 5-year average of \$51 million, which is also in line with industry  
12 averages.<sup>41</sup> As can be seen in Figure 6, when fixed costs projections are more  
13 realistic, East Bend becomes even less economic to operate. My analysis  
14 estimates it will incur net losses of \$261 million (on a NPV basis) over its current  
15 lifetime, or an average of \$32 million per year (2022\$). These estimates assume  
16 PJM's BRA auction price as a capacity value. Even when I apply high  
17 conservative CONE values to estimate the capacity value (still correcting for  
18 fixed costs), East Bend breaks even.

1  
2

**Figure 6. Confidential projected net revenues for East Bend, with corrected fixed costs, assuming carbon regulation and BRA capacity values**

3

4

*Source: see description in text.*

5

**Q DEK separately models its system without any carbon regulations. What do your findings show about the future financial performance of East Bend in that scenario?**

6

7

8

**A** Using DEK's values (i.e., no corrections) from its no carbon regulation scenario modeling, East Bend nets positive revenues from 2023 to 2034. Assuming PJM BRA capacity prices, East Bend has a lifetime NPV revenue (2023 to 2034) of \$91 million. East Bend is projected to net higher positive revenues when assuming a CONE value for capacity. However, as I discuss below, DEK's assumptions for this scenario are flawed and are highly unlikely to be realized.

9

10

11

12

13

1 **Q What are the Company’s projected utilization rates for East Bend in a future**  
2 **without carbon regulation?**

3 **A** In the Company’s modeling without carbon regulation, DEK projects East Bend’s  
4 capacity factor will increase from [REDACTED]  
5 [REDACTED] (Figure 3). But as even DEK itself admits, the scenario with a  
6 carbon price represents a far more realistic future. To reiterate, it is highly  
7 unlikely that utilization for an aging coal plant such as East Bend will increase  
8 significantly and sustain itself at the levels DEK modeled, especially given the  
9 likelihood of increasing environmental regulations, fuel price volatility, and  
10 falling renewable costs. The results without a carbon scenario likely overstate  
11 capacity factor, expected revenue forecasts, and forward-going costs. As a result,  
12 the scenario without a carbon price does not reflect a reasonably likely future for  
13 East Bend.

14 In the next two responses, I will discuss why capacity factors should fall as a  
15 result of (1) East Bend’s increasing age and (2) renewable energy adoption. In the  
16 subsequent response, I will critique East Bend’s associated LMP assumptions.

17 **Q Why is East Bend’s utilization expected to fall as a result of its increasing**  
18 **age?**

19 **A** DEK is projecting capacity factors of [REDACTED]  
20 [REDACTED] This is unusually high for a coal power plant, and especially high for a  
21 plant over the age of 40. Average annual capacity factors for coal generators in  
22 the United States have been between 53 percent and 61 percent since 2012,<sup>42</sup> and  
23 as discussed above, East Bend’s average capacity factors over the past five years  
24 have been between 43 and 60 percent. These levels are all much lower than what

---

<sup>42</sup> U.S. Energy Information Administration (EIA). Electric Power Monthly, Table 6.07.A. Capacity Factors for Utility Scale Generators Primarily Using Fossil Fuels, *available at* [https://www.eia.gov/electricity/monthly/epm\\_table\\_grapher.php?t=epmt\\_6\\_07\\_a](https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_6_07_a).

1 DEK is projecting. I am not aware of any comparable coal plants projecting such  
2 high utilization rates going forward. Even if East Bend is well maintained, it is  
3 unreasonable to assume that East Bend is immune from the forced outages and  
4 breakdowns that accompany an aging generator.

5 **Q How will market dynamics affect East Bend's utilization rates?**

6 **A** Since wind and solar have a dispatch price of zero, they displace the marginally  
7 priced resources, which are typically expensive and aging fossil plants. This puts  
8 downward pressure on LMPs; PJM forecasts that average LMPs could fall by as  
9 much as 26 percent in the future as a result of renewable energy adoption.<sup>43</sup> Not  
10 only do lower LMPs mean that East Bend and other fossil fuel generators will be  
11 less cost-competitive and be dispatched less, but East Bend's energy revenues will  
12 also fall and thus become even more uneconomic. This dynamic will continue  
13 regardless of whether or not there is a carbon price. Company Witnesses,  
14 including Ms. Lawler,<sup>44</sup> Mr. Luke,<sup>45</sup> Mr. Scott,<sup>46</sup> and Mr. Swez,<sup>47</sup> all commented  
15 in their direct testimonies that East Bend's capacity factors will decline in the  
16 future rather than grow and stay elevated.

17 For example, DEK placed East Bend on reserve shutdown status for 57 days  
18 during the beginning of the COVID-19 pandemic in 2020 as a result of low LMPs  
19 during that period.<sup>48</sup> Costs were projected to exceed energy and ancillary

<sup>46</sup> Direct Testimony of Scott Park, pg. 8.

<sup>47</sup> Direct Testimony of John D. Swez, pg. 10.

<sup>48</sup> Direct Testimony of John D. Swez, pg. 9.

1 revenues, and East Bend became too uneconomic to run.<sup>49</sup> Company witness Mr.  
2 Swez notes the likelihood of more reserve shutdown instances in both the short  
3 term and longer term due to variable costs exceeding energy market revenues,<sup>50</sup>  
4 which in turn reduces the capacity factor and energy revenues for East Bend.

5 **Q What are DEK assumptions about future LMPs?**

6 **A** DEK is projecting that on an annual basis, LMPs will remain flat at least until  
7 2027, aside from seasonal variations (Figure 7).<sup>51</sup> According to DEK's forecast of  
8 generation and energy revenues for the no carbon scenario, DEK is assuming that  
9 LMPs will [REDACTED]<sup>52</sup> This is out  
10 of sync with Company witness testimony.<sup>53</sup> Although DEK understands that  
11 LMPs should fall, the Company has not updated its modeling and forecasts to  
12 include this critical assumption.

<sup>49</sup> *Ibid.*

<sup>50</sup> Direct Testimony of John D. Swez, pg. 10.

<sup>51</sup> DEK response to Sierra Club request 1-14(a).

<sup>52</sup> DEK response to Sierra Club request 2-2 Confidential Attachment 5.

<sup>53</sup> Direct testimony of Scott Park, pg. 9.

1

**Figure 7. DEK forecast of locational marginal prices from 2023 to 2027**

2

3

*Source: DEK response to Sierra Club request 1-14(a).*

4

In the scenario with carbon regulation, DEK assumes that LMPs will increase as a result of carbon regulation driving up the cost to operate existing fossil units.<sup>54</sup>

5

Unfortunately, this means that there is no modeled scenario in which LMPs decline. Understanding the impact of declining LMPs as a result of greater

6

renewable energy adoption will provide a better understanding of East Bend's future operational and economic performance.

7

10 **Q**

**What do your findings show about the future financial performance of East Bend, assuming no carbon regulation but with more appropriate fixed costs and capacity factor assumptions?**

11

12

13 **A**

As described above, I am concerned that DEK's fixed-spending assumptions are unrealistically low and do not account for the aging of the East Bend plant.

14

15

Although the modeling scenario in question has no carbon regulation, East Bend's

<sup>54</sup> Calculation using data from DEK response to Sierra Club request 2-2 Confidential Attachment 5.

1 fixed costs are still not expected to decline going forward; they should at a  
2 minimum be on par with historical spending.

3 Likewise, DEK's forecasted generation revenue is inconsistent with the current  
4 reality of the energy market. Even without carbon regulation, East Bend  
5 generation revenue will likely decline as LMPs fall and East Bend fails to  
6 compete with the low-cost renewables on the grid.

7 First, I corrected East Bend's fixed spending to be more in line with historical  
8 spending and the industry standard for similar plants.<sup>55</sup> With this change, East  
9 Bend incurs net losses of \$47 million (NPV) from 2023–2034.

10 Second, I corrected capacity factors to be on par with those of typical coal  
11 plants,<sup>56</sup> and I changed the variable O&M, fuel costs, and energy revenues  
12 proportionally. When correcting for both fixed costs and capacity factors,<sup>57</sup> East  
13 Bend incurs net revenue losses of \$154 million (NPV) over the course of its life,  
14 or \$17 million per year (\$2022) (assuming PJM BRA capacity values). For the  
15 reasons described above, I believe this is a more realistic modeling scenario for  
16 future net revenues for East Bend (assuming no carbon price).

17 **Q What do you conclude regarding the economic performance of East Bend**  
18 **and its future retirement?**

19 **A** As summarized in Table 2 below, my analysis shows that, under most likely  
20 future scenarios, East Bend will be uneconomic to operate going forward.

---

<sup>55</sup> See description above for the analysis without carbon regulation.

<sup>56</sup> Five-year average for coal plants, from EIA Table 6.07.A. Capacity Factors for Utility Scale Generators Primarily Using Fossil Fuels, *available at* [https://www.eia.gov/electricity/monthly/epm\\_table\\_grapher.php?t=epmt\\_6\\_07\\_a](https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_6_07_a).

<sup>57</sup> Corrected capacity factor starting in 2025 to be 10-year average for coal plants. Assume 1-percent decline starting in 2027. Coal plant average from EIA Table 6.07.A. Capacity Factors for Utility Scale Generators Primarily Using Fossil Fuels, *available at* [https://www.eia.gov/electricity/monthly/epm\\_table\\_grapher.php?t=epmt\\_6\\_07\\_a](https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_6_07_a).

1 Specifically, assuming DEK’s forward-going spending to maintain its coal plant  
 2 is in line with its historical spending, and/or there are increased carbon  
 3 regulations, I find that East Bend is expected to incur costs in excess of its value  
 4 of between \$261 million and \$154 million. Only under unrealistically  
 5 conservative scenarios, specifically with a high capacity value or no  
 6 environmental regulations, is the plant expected to perform economically.

7 **Table 2: Summary of NPV projected net revenues for East Bend, 2023–2034 (\$million) for**  
 8 **various scenarios**

<b>Modeling Scenario</b>	<b>Capacity Price</b>	<b>Corrections</b>	<b>NPV (2023–2034)</b>	<b>Annual Average (\$2022)</b>
Base with CO <sub>2</sub>	PJM BRA	--	(\$123)	(\$14)
Base with CO <sub>2</sub>	Net CONE	--	\$159	\$20
Base with CO <sub>2</sub>	PJM BRA	Fixed cost (historical avg)	(\$261)	(\$32)
Base without CO <sub>2</sub>	PJM BRA	--	\$91	\$15
Base without CO <sub>2</sub>	PJM BRA	Fixed cost (historical avg)	(\$47)	(\$3)
Base without CO <sub>2</sub>	PJM BRA	Fixed cost (historical avg) + capacity factor (10-yr industry avg)	(\$154)	(\$17)

9 *Source: See individual results discussed above.*

10 **Q What do you find regarding DEK’s analysis in this case?**

11 **A** Overall, I find that the forecasts and analysis DEK relied on in this rate case lack  
 12 accuracy and reasonableness, and they fail to capture the market changes already  
 13 underway. While forecasting comes with uncertainty, it is irresponsible for the  
 14 Company to assume that our future is business-as-usual, that fixed spending will  
 15 decline as compared to historical spending, or that the capacity factor will  
 16 increase so significantly in a manner inconsistent with other coal plants. My  
 17 findings demonstrate how important it is for DEK to perform, and for the  
 18 Commission to have access to, robust analyses to evaluate the cost of continuing  
 19 to operate East Bend, to avoid locking in ratepayer costs for fuel, O&M, and fixed  
 20 capital costs for the long-term. Based on my findings, I recommend that DEK

1           commit to an earlier retirement date for East Bend and take the plant offline no  
2           later than 2030.

3   **Q     Explain why you added the full cost of each expenditure in the year it was**  
4           **incurred instead of annualizing the costs over the remaining life of the plant?**

5   **A     I expensed the full cost of each capital expenditure in the year it was incurred**  
6           because this approach is more robust against early retirements. In years where  
7           DEK undertakes large projects, capital expenditures will likely exceed the  
8           resources' total revenues and value; but the reverse is also true. And over a multi-  
9           year timeframe, if the plant is operating economically, the total costs incurred and  
10          total energy revenues earned plus capacity value should at the very least net out.  
11          If they do not, meaning that the plant's total fixed and variable costs consistently  
12          sum to more than its total energy market revenues plus capacity value, then  
13          continuing to invest in the plant is not in ratepayers' interest on a forward-going  
14          basis.

15          In contrast, the Company typically annualizes capital expenditures (based on the  
16          utility's cost of capital) and spreads the costs out over the remaining economic  
17          life of the plant. This approach is reasonable with projects where there is a  
18          reasonable degree of certainty that the plant will operate through its planned  
19          retirement date. But it is dangerous with aging resources such as coal plants that  
20          we know are likely to retire early. A project might look economic when spread  
21          out over 12 years with 12 years of energy market revenues and capacity value to  
22          balance it out. But if it has to be recovered over only five or eight years instead  
23          (with only five to eight years of revenue and value as well), it suddenly becomes  
24          clear how expensive and uneconomic it was to invest in the plant.

1    **Q     Is there any deviation from industry practice in terms of DEK data quality?**

2    **A     Yes. DEK provided incorrect data on its East Bend costs and revenue forecasts,**  
3           and the Company only corrected the data eight days before the testimony filing  
4           date. Revised data was sent two days before the testimony filing date.

5           Furthermore, the Company’s responses to questions were at times unclear and  
6           obtuse, adding more confusion than clarity.

7           Based on my own experience and the experience of my colleagues, this is not in  
8           line with industry standard practice of providing accurate and high-quality data  
9           through discovery.

10       ***iii. There are mounting risks and costs associated with relying heavily on coal-fired***  
11       ***generation; these can be avoided with an early East Bend retirement***

12    **Q     What is Duke Energy Kentucky’s current generation mix and what is its**  
13       **projected energy portfolio?**

14    **A     East Bend provided over half of the Company’s energy generation (Figure 8) and**  
15       **capacity mix (Figure 9) in 2020.**

1

**Figure 8. Duke Energy Kentucky's generation mix in 2020**

2

3 *Source: Figure 4.2 of DEK's 2021 IRP.*

4 **Figure 9. Duke Energy Kentucky's capacity mix (UCAP)**

5

6 *Source: Figure 4.2 of DEK's 2021 IRP.*

7 Going forward, DEK projects that East Bend will provide roughly 50 percent of  
8 generating capacity for its customers over the next decade (Figure 10).

1

**Figure 10. Duke Energy Kentucky’s generating capacity, 2021–2035**

2

3 *Source: Figure 7.1 of DEK’s 2021 IRP.*

4 DEK and its ratepayers are relying heavily on coal for their energy and capacity  
5 needs, which exposes them to avoidable costs and puts them in a risky position, as  
6 I will explain in greater detail throughout this section.

7 **Q Are there avoidable costs and risks associated with continuing to rely on East**  
8 **Bend as a generating asset?**

9 **A** Yes. There are numerous risks and costs for DEK ratepayers, who receive roughly  
10 half of their energy from a single, aging coal plant. Many of these can be  
11 mitigated with early retirement. They include (1) fuel price volatility, (2) future  
12 environmental compliance costs, (3) operational costs associated with running  
13 aging fossil fuel resources, (4) issues of coal supply and transportation, (5)  
14 reliability risks posed by extreme weather, and (6) forced outage risks associated  
15 with operating an aging plant. I will cover each of these six key risks—and the  
16 associated benefits of earlier retirement of East Bend—in the next six responses.

1 **Q** Please describe the avoided fuel costs associated with an earlier East Bend  
2 retirement.

3 **A** With such a significant portion of DEK energy coming from coal, ratepayers have  
4 high exposure to fuel price volatility. Coal, natural gas, and oil prices are  
5 determined in large part by global markets and are influenced by numerous  
6 factors including rail and pipeline access, natural gas reserves in Europe, volume  
7 of exports and imports, extreme weather, etc. As can be seen in Figure 11 below,  
8 prices for coal from the Appalachian regions and Illinois Basin experienced  
9 significant volatility in the last year. DEK purchases coal for East Bend from  
10 these regions.<sup>58</sup>

11 **Figure 11. Historical coal prices by region, January 2011 to February 2023**

12

13

14

Source: U.S. EIA average weekly coal commodity spot prices. Available at <https://www.eia.gov/coal/markets/#tabs-prices-2>.

<sup>58</sup> U.S. Energy Information Administration Form 923.

1           When fuel prices are high, ratepayers are on the hook to pay for high-cost  
2           electricity. In fact, over the last five years, fuel prices accounted for half of costs  
3           at East Bend, on an annual average basis.<sup>59</sup>

4           Not only do high and volatile fuel prices influence East Bend’s generation costs,  
5           but high prices also drive up LMPs across the region, further driving up the cost  
6           of electricity for DEK and its ratepayers. If DEK retires East Bend early and adds  
7           more solar and wind resources to its portfolio, ratepayers will have a buffer from  
8           these impacts. If DEK continues to rely on East Bend, as well as the spot market,  
9           its ratepayers will bear the full burden of high and volatile fuel prices.

10   **Q     Please describe the risks and costs from environmental regulation that will**  
11   **be avoided with an earlier East Bend retirement.**

12   **A**There are two additional categories of potential environmental compliance risk  
13           facing East Bend over the next decade: (1) ongoing implementation of the  
14           National Ambient Air Quality Standards (“NAAQS”) for ozone, and (2) Clean  
15           Water Act Effluent Limitations Guidelines for coal-burning plants and Resource  
16           Conservation and Recovery Act regulations governing coal ash disposal.

17           First, as noted in DEK’s IRP, ongoing implementation of the ozone NAAQS and  
18           the non-attainment status of the Cincinnati area may lead to additional reductions  
19           in nitrogen oxide emission allocations to East Bend, or the performance upgrade  
20           of selective catalytic reduction technology (SCR).<sup>60</sup> Although DEK did not  
21           provide any detailed information on projected costs associated with NAAQS

---

<sup>59</sup> See description in Section 4(i) on historical economic performance evaluation methodology.

<sup>60</sup> 2021 Integrated Resource Plan, Duke Energy Kentucky, pg. 141.

1 implementation via our discovery request,<sup>61</sup> costs could be substantial. As a  
2 result, the Company may be faced with the prospect of earlier retirement or a  
3 costly upgrade for East Bend in the early- to mid-2020s.<sup>62</sup>

4 Second, as the Company also acknowledges in its IRP, compliance with the U.S.  
5 Environmental Protection Agency’s (“EPA”) forthcoming updates to its Clean  
6 Water Act Effluent Limitation Guidelines and Coal Combustion Residuals rules  
7 may require additional capital and O&M investments at East Bend. Specifically,  
8 “more stringent discharge limitations (such as for bromides), may ultimately  
9 necessitate additional waste processing changes and/or equipment installations.”<sup>63</sup>  
10 As with potential ozone compliance risk, DEK refused to provide detailed future  
11 cost estimates related to the implementation of the Clean Water Act or coal ash  
12 regulations,<sup>64</sup> but the Company projects that such costs may be required in the  
13 early 2030s.<sup>65</sup> On March 8, 2023, EPA proposed revisions to its Effluent  
14 Limitations Guidelines for coal-fired plants, which, if finalized, would require  
15 facilities like East Bend to eliminate FGD wastewater discharges by 2029;  
16 alternatively, for facilities that are in full compliance with EPA’s existing rules,  
17 the source may commit to cease burning coal by 2032, in lieu of installing  
18 additional technology to comply with the updated standard.<sup>66</sup>

<sup>66</sup> U.S. Environmental Protection Agency, Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category (prepublication version signed Mar. 7, 2023), *available at* [https://www.epa.gov/system/files/documents/2023-03/Prepublication%20FRN\\_OW\\_Steam%20Electric%20ELG\\_NPRM\\_03\\_07\\_2023\\_1.pdf](https://www.epa.gov/system/files/documents/2023-03/Prepublication%20FRN_OW_Steam%20Electric%20ELG_NPRM_03_07_2023_1.pdf).

1 **Q Please describe the avoided O&M and sustaining capital costs associated**  
2 **with an earlier East Bend retirement.**

3 **A** Fixed O&M and sustaining capital costs make up a significant part of spending at  
4 East Bend; these are costs that are passed on entirely to ratepayers. Protecting  
5 ratepayers from unnecessary costs is especially important given East Bend's age.  
6 Total spending on sustaining capital expenses is likely to increase with the need  
7 for additional refurbishments of aging equipment, replacement of older parts, etc.

8 For wind and solar, O&M and sustaining capital costs are relatively low. As more  
9 renewable resources are added to DEK's portfolio after East Bend's retirement, its  
10 O&M spending should decline. This in turn will lower revenue requirements and  
11 reduce costs passed on to ratepayers.

12 **Q Please describe the risks posed by coal supply and transportation issues that**  
13 **will be mitigated with an earlier East Bend retirement.**

14 **A** Utilities around the country have experienced issues with their coal supplies over  
15 the last few years. For instance, the coal supplier for the San Juan Power Station  
16 in New Mexico was unable to supply the contracted amount of coal to that plant  
17 in 2022. As a result, the plant owners had to reduce how much they operated the  
18 plant.<sup>67</sup> Next door in Arizona, labor shortages in 2022 prevented Burlington  
19 Northern Santa Fe Railroad from delivering all the coal it was contracted to  
20 provide to Tucson Electric Power Company in 2022.<sup>68</sup> More generally in 2022,  
21 rail labor shortages—with employment down 20.4 percent since January 2019—  
22 inhibited the movement of coal throughout the country and contributed to soaring

---

<sup>67</sup> Direct Testimony of Devi Glick, pg. 32, Docket No. E-01933A-22-0107, Arizona Corporation Commission (Jan. 11, 2023).

<sup>68</sup> *Ibid.*

1 prices.<sup>69</sup> Similarly, the potential but avoided rail strike in fall of 2022 was a major  
2 threat to the coal industry. In fact, the coal industry is almost entirely dependent  
3 on railways, further exposing vulnerabilities of the coal supply chain.<sup>70</sup> DEK’s  
4 heavy reliance on the East Bend coal plant exposes ratepayers to the risk of fuel  
5 supply constraints, as a result of these kinds of transportation or coal mine supply  
6 issues, which could result in paying high prices for replacement market energy—  
7 potentially for a lengthy period of time.

8 **Q Please describe the risks posed by extreme weather that will be mitigated**  
9 **with an earlier East Bend retirement.**

10 **A** Water is essential for cooling steam-fired generators, including coal plants. This  
11 can cause problems during droughts or other extreme weather events, and it is not  
12 just a hypothetical threat to coal-fired generators; Southwest Public Service  
13 Company in New Mexico accelerated the retirement date of the Tolk Generating  
14 Station twice in five years due to water shortages.<sup>71</sup> East Bend is located on the  
15 Ohio River, which experienced a drought in 2022.<sup>72</sup> Should the duration and/or

<sup>72</sup> National Weather Service, “Low River Stages along the Lower Ohio and Mississippi Rivers,” *available at* <https://www.weather.gov/pah/LowRiverStages2022>, and National Integrated Drought Information System. “Drought Conditions for Boone County,” *available at* <https://www.drought.gov/states/kentucky/county/boone>.

1 frequency of Ohio River droughts intensify, they would likely threaten East  
2 Bend’s ability to generate and potentially impact generation for months.

3 Water shortage issues can also occur with ice dams and blockages from cold  
4 weather events. During Winter Storm Elliot in December of 2022, ice on the  
5 Missouri River threatened 1000s of MWs of generation, as noted by Southwest  
6 Power Pool.<sup>73</sup>

7 Weather-related impacts to coal generators are happening in Kentucky too; all of  
8 TVA’s coal plants in Kentucky had loss of availability during Storm Elliot.<sup>74</sup>  
9 When East Bend goes down during a storm, DEK and its ratepayers are forced to  
10 pay for replacement energy when prices are sky high; or worse, reliability suffers.

11 **Q Please describe the forced outage risks associated with operating an aging**  
12 **plant that will be mitigated with an earlier East Bend retirement.**

13 **A** The risk of forced outages is also a concern, especially given that East Bend is  
14 over 40 years old. As generators age, the likelihood and frequency of forced  
15 outages increases. For instance, CenterPoint’s Culley Unit 3 in Indiana was shut  
16 down unexpectedly for nearly six months due to a turbine failure. Not only did  
17 this put reliability at risk, but it has also led to a rate hike for CenterPoint

<sup>74</sup> Joint House & Senate Natural Resources & Energy Committee, Kentucky Legislature. February 2, 2023, Testimony of Arron Melda, Senior Vice President, Transmission and Power Supply, Tennessee Valley Authority, *available at* <https://www.ket.org/legislature/archives/?nola=WGAOS+024020&stream=aHR0cHM6Ly81ODc4ZmQxZWQ1NDIyLnN0cmVhbWxvY2submV0L3dvcmlRwcmVzcy9fZGVmaW5zdF8vbXA0OndnYW9zL3dnYW9zXzAyNDAYMC5tcDQvcGxheWxpc3QubTN1OA%3D%3D>.

1 customers to cover the cost of replacement energy.<sup>75</sup> Similarly, as East Bend  
2 continues to age, total spending on replacement parts and maintenance will  
3 continue to grow, increasing costs to DEK and its ratepayers and increasing the  
4 likelihood of more forced outages.

5 More forced outages also impact capacity value. A higher forced outage rate  
6 results in a lower Unforced Capacity (UCAP). This means that, over time, East  
7 Bend will provide less and less capacity for the Company to use to satisfy its FRR  
8 Plan or to monetize in the PJM capacity auctions and through bilateral sales.<sup>76</sup>  
9 Recall that East Bend provides roughly half of DEK's capacity and will continue  
10 doing so for the next decade. Starting to build out resources that provide capacity  
11 now, ahead of prolonged forced outages and/or noticeable deteriorations in East  
12 Bend's UCAP, will serve customers in the long run.

13 ***iv. DEK should start building replacement resources for East Bend sooner rather***  
14 ***than later***

15 **Q What alternatives has Duke Energy considered for replacement resources?**

16 **A** According to its IRP, DEK is considering natural gas-fired turbines (combustion  
17 turbine and combined-cycle), nuclear, solar photovoltaic, onshore wind, and  
18 battery storage.<sup>77</sup> Specifically, the Company is planning on replacing East Bend  
19 with a firm, dispatchable resource,<sup>78</sup> which the Company suggests will likely be

<sup>75</sup> Schneider, K., "CenterPoint Energy request 3-month rate hike for 2023 following coal plant failure," Indianapolis Star, Nov. 25, 2022, *available at* <https://www.indystar.com/story/news/2022/11/25/centerpoint-files-for-rate-hike-following-coal-plant-malfunction/69670232007/>.

<sup>76</sup> Direct Testimony of John D. Swez, pg. 15.

<sup>77</sup> Duke Energy Kentucky, 2021 Integrated Resource Plan, pg. 38.

<sup>78</sup> Direct Testimony of William Luke, pg. 14.

1 combined cycle natural gas or nuclear.<sup>79</sup> As part of DEK’s long-term planning,  
2 DEK also plans on adding more renewables, which will make up 16 and 22  
3 percent of generating capacity by 2030 and 2035, respectively.<sup>80</sup>

4 **Q Are there risks with the resources DEK is considering?**

5 **A** Yes. As I have discussed, there are numerous risks associated with reliance on  
6 thermal plants, such as fuel supply, volatile fuel prices, and extreme weather,  
7 among others. Though no resource is perfect, solar and wind, especially when  
8 paired with batteries, can mitigate many of these risks and costs that are passed  
9 onto ratepayers. Furthermore, adding diversity in terms of plant size, number,  
10 location and resource type also adds flexibility and reliability to DEK’s portfolio.

11 **Q Has DEK started to build replacement resources?**

12 **A** No. Although the Company is continually evaluating replacement of East Bend,<sup>81</sup>  
13 I am not aware that DEK has started to build energy or capacity resources in  
14 preparation for East Bend’s retirement.

15 **Q Should DEK wait until closer to East Bend’s retirement before starting to**  
16 **procure or build replacement resources?**

17 **A** No, the Company should begin building resources as soon as possible.

18 My analysis shows the outlook for East Bend’s economic performance is shaky at  
19 best. As Company witness Mr. Park has already stated, “the retirement of East

---

<sup>79</sup> Direct Testimony of Scott Park, pg. 9.

<sup>80</sup> Duke Energy Kentucky, Integrated Resource Plan, pg. 4.

<sup>81</sup> Direct Testimony of Scott Park, pg. 9.

1 Bend is more likely to be sooner than 2035 rather than later.”<sup>82</sup> The clock is  
2 ticking: DEK may not have as much time as it currently expects.

3 Currently, there are numerous tax benefits available that DEK should act on now.  
4 The IRA increased the tax credits available for solar and wind and introduced new  
5 tax credits for batteries. However, many of these could expire within the next 10  
6 years; acting now ensures that DEK and its customers can still benefit. For  
7 example, through the IRA, utility-scale wind and solar are now both eligible for a  
8 30 percent investment tax credit (ITC), which increases to 40 percent if the  
9 facility is located in an energy community.<sup>83</sup> Stand-alone battery storage is also  
10 newly eligible for a 30 percent ITC. The IRA also increased production tax credits  
11 (PTC): it increased wind and solar PTCs to \$26/MWh (\$2022). However, the new  
12 ITC and PTC options could be phased out in 2032.<sup>84</sup> Another example is IRA  
13 funding that supports the retirement of aging coal plants and other assets. Through  
14 the U.S. Department of Energy’s Loan Program Office, the IRA creates a \$5  
15 billion fund for low-cost loans that can be used similarly to ratepayer-backed  
16 bond securitization.<sup>85</sup> This program is scheduled for phase-out in 2026.<sup>86</sup>

---

<sup>82</sup> Direct testimony of Scott Park, pg. 10.

<sup>83</sup> Energy community includes census tracts where a coal-fired electric generating unit has been retired since 2009, statistical areas with 0.17% or greater fossil fuel employment since 2010, or 25% or greater local tax revenues related to fossil fuel extraction, processing, or transport.

<sup>84</sup> The later of 2032 or the first year that greenhouse gas emissions from U.S. electricity production are less than or equal to 25 percent of 2022 levels. Inflation Reduction Act, Pub. L. No. 117-169, § 13701 (Aug. 16, 2022), *available at*: <https://www.congress.gov/bill/117th-congress/house-bill/5376/text>.

<sup>85</sup> Solomon, M., “Inflation Reduction Act Benefits: Billions In Just Transition Funding For Coal Communities,” *Forbes*, Aug. 24, 2022, *available at* <https://www.forbes.com/sites/energyinnovation/2022/08/24/inflation-reduction-act-benefits-billions-in-just-transition-funding-for-coal-communities/?sh=3100554e6ebd>.

<sup>86</sup> Inflation Reduction Act, Pub. L. No. 117-169, § 1706 (Aug. 16, 2022), *available at*: <https://www.congress.gov/bill/117th-congress/house-bill/5376/text>.

1 As I and Company witnesses have discussed, the electricity market is changing,  
2 and East Bend will be outcompeted over time by renewables. East Bend is also  
3 aging and exposed to risks that include extreme weather and fuel supply risks.  
4 East Bend may be placed on reserve shutdown more frequently, experience more  
5 forced outages and derates, or be forced to retire early. Preparing now to avoid  
6 expensive replacement energy purchases in the future will benefit ratepayers.

7 Furthermore, the build-out of new resources can take many years. There are  
8 numerous implementation barriers, including the PJM interconnection queue.  
9 Starting early improves DEK’s preparedness for East Bend’s retirement, whether  
10 in this decade or the next.

11 **5. MECHANISMS TO MITIGATE THE RATE IMPACTS OF EARLY EAST BEND RETIREMENT**

12 **Q Describe the rate impacts that might occur with early retirement.**

13 **A** If the depreciation schedule is advanced, the period shortens, and rates could  
14 increase. Another option would be to convert East Bend to a regulatory asset with  
15 the full rate of return allowed. Under this option, customers in the future will  
16 continue to pay for its depreciation while also paying for replacement energy.  
17 This can result in unequal intergenerational impacts. A third option, disallowance  
18 of the remaining depreciation value, though an immediate relief to ratepayers, can  
19 impact the Company’s ability to pay off its debts. This would affect its credit  
20 score and potentially make future projects more expensive.<sup>87</sup>

21 However, DEK and the Commission have another option to consider to help  
22 minimize the costs and barriers associated with early retirement: a financial  
23 instrument known as ratepayer-backed bond securitization.

---

<sup>87</sup> Varadarajan, U., Posner, D., Fisher, J., “Harnessing Financial Tools to Transform the Electric Sector.” Sierra Club (November 2018).

1 **Q Please describe securitization in more detail.**

2 **A** Ratepayer-backed bond securitization could be a win-win for both customers and  
3 the Company, in instances when costs are almost certain to be passed on to  
4 ratepayers. It would enable the Company to recover the full undepreciated amount  
5 of East Bend without increasing rates for customers.

6 Securitization is a refinancing mechanism; bonds are issued to raise funds to  
7 refinance the plant's undepreciated value. These bonds are paid back over time by  
8 customers through a dedicated surcharge on their bills. Although collected on  
9 utility bills, the payments go to the debt investors, rather than the utility.  
10 Importantly, the customer bond repayment surcharge is irrevocable and non-  
11 bypassable.<sup>88</sup> In other words, payment is guaranteed to the lender; there is zero  
12 risk that future ratepayers will not pay the bond in the future. This guarantee, or  
13 "securitization" of the repayment, means that the bond can be issued at a lower  
14 interest rate compared to typical utility interest rates.<sup>89</sup> Furthermore, many major  
15 credit rating agencies exclude securitization debt in their assessment of debt-to-  
16 equity ratio for utility credit scoring. This exclusion allows utilities to refinance  
17 the remaining net book value through 100-percent securitization, rather than the  
18 typical combination of debt-to-equity financing.<sup>90</sup> The lower interest rate,  
19 combined with 100-percent securitization financing, means that customers  
20 ultimately pay a lower overall cost compared to paying the utility directly. The

---

<sup>88</sup> "Securitization for Generation Asset Retirement: Study Group Work Products," 2020 North Carolina Energy Regulatory Process, Dec. 18, 2020, *available at* <https://files.nc.gov/ncdeq/climate-change/clean-energy-plan/Securitization-Products-Final.pdf>.

<sup>89</sup> *Ibid.*

<sup>90</sup> *Ibid.*

1 utility also benefits by recovering of the remaining undepreciated value of the  
2 plant.

3 **Q How is bond securitization implemented?**

4 **A** Regulators create a special purpose entity, which issues the bond on behalf of  
5 ratepayers.<sup>91</sup> The entity also owns the future ratepayer charges (which are still  
6 collected on the utility bill) and repays the bond using those charges. This entity  
7 must be “bankruptcy remote” from the utility. In other words, should the utility  
8 encounter financial problems, the ratepayer charges dedicated to the bond would  
9 not be available to the utility or its creditors.<sup>92</sup> Once the obligations to the  
10 bondholders are met, the surcharge is removed from customer bills.

11 **Q Please describe the potential benefits of securitization for utilities in more**  
12 **detail.**

13 **A** Through securitization, the utility collects the full outstanding value of the plant;  
14 its return of capital is satisfied. Yet the return on capital, or the utility’s earnings,  
15 is limited. However, the capital released through securitization can be re-invested  
16 in other capital projects, which has the potential to increase total utility earnings.<sup>93</sup>  
17 This is especially true if the utility invests in clean energy, which is typically  
18 more capital intensive to build than fossil plants (on a per-kWh-generated  
19 basis),<sup>94</sup> but has minimal fuel and operational costs. If the plant’s remaining net

<sup>94</sup> Varadarajan, U., Posner, D., Fisher, J., “Harnessing Financial Tools to Transform the Electric Sector.” Sierra Club (November 2018)

1 book value is released through securitization, and re-invested in other capital  
2 projects, shareholders can see profits grow while still benefiting ratepayers.

3 **Q Is there enabling legislation in Kentucky for securitization?**

4 **A** No, not yet. Enabling legislation is required for securitization, to ensure that bond  
5 repayment is irrevocable and non-bypassable and to allow for the creation of the  
6 special purpose entity.<sup>95</sup> Legislation for this has been proposed in Kentucky.<sup>96</sup>

7 **Q Has securitization been recommended before?**

8 **A** Securitization was recommended in Cases No. 2020-00349 and No. 2020-00350,  
9 regarding the recovery of the net book value of Kentucky Utilities’ and Louisville  
10 Gas and Electric Company’s retired coal-fired and gas-fired generating units.

11 **Q Has securitization been adopted in other jurisdictions?**

12 **A** Yes. Securitization is not new. In fact, securitization of stranded assets—  
13 particularly, coal-related assets—is quickly becoming the industry norm. In the  
14 1990s during utility restructuring, utilities selling generation assets could not  
15 always recoup their capital expenses when the book value of the plants turned out  
16 to be higher than their market value. As a result, states and Commissions allowed  
17 for bond securitization to compensate utilities for their stranded assets.<sup>97</sup> Since

<sup>96</sup> An Act Related to Securitization of Public Utilities, S.B. 326 (Ky. introduced Mar. 3., 2022), *available at*: <https://openstates.org/ky/bills/2022RS/SB326/>.

<sup>97</sup> Varadarajan, U., Posner, D., Fisher, J., “Harnessing Financial Tools to Transform the Electric Sector.” Sierra Club (November 2018)

1           then, it has been used widely as a tool to enable early retirements or finance  
2           pollution control upgrades.

3           For instance, securitization was used by Duke Energy Florida to finance \$1.3  
4           billion for the closed Crystal River nuclear plant. The bond interest rate of 2.72  
5           percent was much lower than Duke Energy’s cost of capital, avoiding \$700  
6           million in customer costs over 20 years.<sup>98</sup>

7           The New Mexico Public Regulation Commission approved the use of  
8           securitization to collect \$361 million to recover costs associated with the closure  
9           of San Juan Generating Station.<sup>99</sup> Bond funds will be used to recover the net book  
10          value of the plant, pay for decommissioning, and provide \$40 million for the  
11          economic development of the area, including assistance for laid off coal plant  
12          workers.<sup>100</sup>

13          In 2007, Allegheny Power, next door in West Virginia, used securitization bonds  
14          to finance \$450 million in environmental controls, saving \$130 million for  
15          ratepayers.<sup>101</sup>

<sup>100</sup> *Ibid.*

<sup>101</sup> Saber Partners, LLC, “State of West Virginia, Public Service Commission,” *available at* <https://saberpartners.com/engagements/state-of-west-virginia-public-service-commission/>.

1 **Q Are there other options for securitization if enabling legislation is not passed**  
2 **in Kentucky?**

3 **A** Yes. In the recently passed IRA, the U.S. Department of Energy’s Loan Program  
4 Office provides \$5 billion in funding to facilitate \$250 billion in low-cost  
5 loans<sup>102</sup>. These government-backed loans act in the same way as ratepayer-backed  
6 bond securitization. Through this provision, the program requires reinvestment of  
7 the released capital. Specifically, utilities will need to “retool, repower, repurpose,  
8 or replace” retiring assets. Funding through this program expires in 2026.

9 **Q What do you recommend for minimizing ratepayer impacts of an early East**  
10 **Bend retirement?**

11 **A** The Commission should order the Company, as part of its IRP, to evaluate the  
12 economics of retiring the plant early (2030 or 2035) and using securitization to  
13 finance the remaining balance. This would minimize the rate shock to customers  
14 while still allowing DEK to recover the capital it invested in the plant.

15 **6. PROPOSED CHANGES TO RATES WILL HINDER EV ADOPTION AND RESULT IN LESS**  
16 **EFFICIENT USE OF THE GRID**

17 **Q What principles should guide rate design?**

18 **A** In his seminal work, *Principles of Public Utility Rates*, Professor James Bonbright  
19 described 10 guiding principles for rate design. These principles can be  
20 summarized as follows:

- 21
- Rates should be designed to yield revenues sufficient to recover utility costs.

---

<sup>102</sup> Inflation Reduction Act, Pub. L. No. 117-169, §§ 50141, 50144(Aug. 16, 2022),  
*available at*: <https://www.congress.gov/bill/117th-congress/house-bill/5376/text>.

- 1 • Rates should be designed so that costs are fairly apportioned among different
- 2 customers, and “undue discrimination” in rate relationships is avoided.
- 3 • Rates should provide efficient price signals and discourage wasteful usage.
- 4 • Rates should be relatively stable, predictable, simple, and easily
- 5 understandable.

6 **Q Do the Company’s rate design proposals follow these principles?**

7 **A** No. In particular, I have concerns regarding the efficiency and fairness of rates for  
8 customers who adopt EVs and who take service on the Company’s proposed Rate  
9 R-TOU-CPP, Rate DT, or under Rider LM (for customers on Rate DS or Rate  
10 DP). My primary concerns are that the Company’s rate design proposals:

- 11 1. Will result in EV customers paying more than their fair share of costs for
- 12 off-peak charging;
- 13 2. Will reduce incentives to shift load to off-peak hours, resulting in less
- 14 efficient use of the grid; and
- 15 3. Will hinder EV adoption by increasing the costs of charging EVs.

16 **Q Do you agree with the Company’s assertion that EV adoption will lead to**  
17 **benefits to all customers?**

18 **A** Yes. The Company correctly argues that the incremental load from EVs will  
19 create a broader base of sales over which to spread utility costs, and that “savings  
20 to all customers are anticipated to result from increasing EV adoption due to  
21 incremental net revenue received by selling electricity to charge EVs in excess of  
22 any increases in costs of service related to the additional load.”<sup>103</sup>

23 At the same time, the Company also notes that the growth in energy usage from  
24 EVs “must be actively managed to assure the greatest benefits for all customers,”

---

<sup>103</sup> Direct Testimony of Cormack Gordon, pg. 4.

1 primarily through smoothing charging load “to reduce the need for infrastructure  
2 growth at all levels.”<sup>104</sup> Here I also agree with the Company that EV customers  
3 should be encouraged to charge in a manner that minimizes additional grid  
4 investments so that the benefits to all customers may be maximized.

5 Despite the Company’s stated intent of simplifying EV adoption and setting the  
6 stage for future load management programs, I find that the Company’s proposed  
7 rates are likely to undermine both goals, as I discuss below.

8 **Q How does the Company propose to reduce the need for additional**  
9 **infrastructure due to EV charging load?**

10 **A** The Company states that it will leverage its proposed Make Ready Credit (MRC)  
11 and Electric Vehicle Service Equipment (EVSE) tariffs to market managed  
12 charging options to customers. For residential customers, managed charging  
13 would be accomplished through the Company’s proposed RS-TOU-CPP rate that  
14 encourages customers to avoid charging during on-peak hours, and particularly  
15 during critical peak hours when the electric system is most stressed.<sup>105</sup> The  
16 Company does not propose any new rates aimed at strengthening incentives for  
17 off-peak charging for commercial customers.

18 **Q Will the Company’s rate design proposals support the adoption of EVs and**  
19 **encourage customers to charge EVs during off-peak hours?**

20 **A** No, for two reasons:

- 21 • First, the Company’s proposed RS-TOU-CPP rate is unlikely to attract  
22 widespread enrollment in the rate, as it offers only a modest reduction in off-  
23 peak and super-off-peak (“discount”) prices relative to the standard residential

---

<sup>104</sup> Direct Testimony of Cormack Gordon, pg. 6.

<sup>105</sup> Direct Testimony of Cormack Gordon, pg. 6.

1 flat rate. The rate is unlikely to achieve much success in shifting residential  
2 EV load to off-peak hours if few customers enroll.

- 3 • Second, several modifications to the Company’s commercial rates would  
4 actually increase the cost of EV adoption through increasing demand charges,  
5 while reducing incentives for customers to charge during off-peak hours.

6 **Q Please explain why the Company’s proposed RS-TOU-CPP rate is unlikely to**  
7 **attract EV customers to enroll in the rate.**

8 **A** The Company’s proposed RS-TOU-CPP rate offers a very modest price discount  
9 relative to the standard residential rate (RS). Specifically, customers charging  
10 during the off-peak period would save less than a penny per kilowatt-hour, while  
11 customer charging during the discount period would save less than \$0.03/kWh, as  
12 shown in Table 3 below.

13 These rate differentials do not provide substantial savings to a typical residential  
14 EV customer using 300 kWh per month for EV charging. If an EV customer were  
15 to charge 100 percent during the off-peak hours, they would only save \$2.40 per  
16 month. If that customer were able to charge 100 percent during the discount  
17 hours, they would only save \$8.37 per month.

18 **Table 3. Comparison of proposed Rate RS to proposed Rate RS-TOU-CPP, for EV**  
19 **owners charging during off-peak or discount periods**

<b>Rate</b>	<b>Rate Component</b>	<b>\$/kWh</b>	<b>Bill Cost (300 kWh/month)</b>	<b>Monthly Savings Relative to RS</b>
RS	All kWh	\$0.1074	\$32.23	--
RS-TOU-CPP	Critical Peak	\$0.2486	--	--
RS-TOU-CPP	On-Peak	\$0.1491	--	--
RS-TOU-CPP	Off-Peak	\$0.0994	\$29.83	\$2.40
RS-TOU-CPP	Discount	\$0.0795	\$23.86	\$8.37

20 *Source: Direct Testimony of Bruce Sailors, Attachment BLS-1, page 2 of 34.*

1 **Q Why do you argue that savings of between \$2.40 and \$8.37 per month will be**  
2 **insufficient to motivate many customers to enroll in the RS-TOU-CPP rate?**

3 **A** A rate must provide meaningful financial incentives in order for customers to take  
4 the time and effort to enroll in the rate and shift their usage on a regular basis.  
5 This is particularly true for whole-home rates, where the customer also bears the  
6 risk that the rest of their household usage patterns could result in higher bills on  
7 the new rate.

8 In addition, I have reviewed EV tariffs and enrollment levels in multiple other  
9 jurisdictions and have observed that EV rates often suffer from low enrollment  
10 unless they offer the prospect of substantial savings for customers. For example,  
11 Duquesne Light Company in Pennsylvania has offered an EV time-of-use rate  
12 since June 2021. This rate provides approximately \$9 in monthly savings for an  
13 EV customer who can charge during the super-off-peak period. Although  
14 Duquesne Light Company has proactively marketed the rate to customers, only 7  
15 percent of EV drivers in its territory have enrolled in the rate.<sup>106</sup> In Maryland,  
16 Baltimore Gas & Electric's EV time-of-use rate offers approximately \$10.50 in  
17 monthly savings for EV charging, but the utility successfully enrolled less than 5  
18 percent of its EV customers on the rate between May 1, 2020 and June 30,  
19 2022.<sup>107</sup>

---

<sup>106</sup> Personal communications with Emily Phan-Gruber and Lindsay Baxter of Duquesne Light Company on January 25, 2023. Duquesne Light Company offers customers a \$50 incentive simply for registering their vehicle with the utility. Of approximately 7,300 EV customers, 1,644 have claimed the incentive. However, only 522 have enrolled in the EV-TOU rate.

<sup>107</sup> Baltimore Gas & Electric, Case No. 9478, BGE Semi-Annual Progress Report (Aug. 1, 2022), *available at* <https://opendata.maryland.gov/Transportation/MDOT-MVA-Electric-and-Plug-in-Hybrid-Vehicle-Regis/qtcv-n3tc>. The report lists 1,064 customers enrolled in the EV-TOU rate, while data provided by MDOT/ Maryland Motor Vehicle Administration reports 22,169 EV owners in counties served by BGE as of June 2022.

1 **Q Do you recommend any changes to the R-TOU-CPP rate to encourage**  
2 **greater enrollment and load shifting?**

3 **A** Yes. As shown in Attachment BLS-5, page 8, the on-peak to off-peak differentials  
4 in the R-TOU-CPP rate were developed by using generation LMP differentials as  
5 a guide. By only reflecting differentials in energy costs, the Company ignores the  
6 fact that off-peak EV charging imposes lower costs on the distribution grid than  
7 on-peak charging. By ignoring differences in costs on the distribution system, the  
8 proposed design of the R-TOU-CPP rate results in EV customers paying more  
9 than their fair share of distribution costs during the off-peak hours. To more  
10 accurately reflect cost causation and provide greater incentives for customers to  
11 enroll in the rate, I recommend that the Company strengthen the on-peak to off-  
12 peak differential. Reducing the cost of off-peak charging will also provide EV  
13 customers with greater fuel cost savings, which will support greater EV adoption.

14 **Q What proposed modifications to commercial rates do you address in your**  
15 **testimony?**

16 **A** My testimony addresses proposed modifications to commercial rates that would  
17 negatively impact transportation electrification in the Company's territory.  
18 Specifically, the Company proposes the following changes to its Time-of-Day  
19 Distribution Voltage Rate DT and Rider LM (for Rates DS and DP):

20 1. For Rate DT, a \$6.23/kW non-coincident demand charge would be added  
21 to recover distribution demand costs. These costs would be removed from  
22 the other rate components.<sup>108</sup> When combined with the tariff's existing  
23 demand charges, the proposal would result in a demand charge of

---

<sup>108</sup> Direct Testimony Bruce Sailors, pg. 10.

1                   \$20.61/kW during winter on-peak hours, \$21.43/kW during summer on-  
2                   peak hours, and \$7.60/kW during all off-peak hours.

3                   2. For customers taking service on Rider LM (Load Management), billed  
4                   demand would be measured as the greater of demand during on-peak  
5                   hours or 50 percent of off-peak hours. Currently Rider LM only assesses a  
6                   demand charge during on-peak hours.

7    **Q     What types of customers take service on Rate DT?**

8    **A**Rate DT is applicable to customers with an average monthly demand of 500 kW  
9                   or greater. Customers on this rate may include EV DC Fast-Charging (DCFC)  
10                  customers or larger fleets customers, such as those with heavy-duty trucks.

11   **Q     What is your concern with the addition of a \$6.23/kW non-coincident**  
12                  **demand charge for Rate DT?**

13   **A**I have two primary concerns.

14                  1. Non-coincident demand charges poorly reflect cost causation and would  
15                  result in customers paying too much for off-peak charging.

16                  2. Non-coincident demand charges would substantially increase costs for  
17                  public DCFC and fleet customers and create additional barriers to  
18                  transportation electrification.

19   **Q     Why do non-coincident demand charges poorly reflect how costs are imposed**  
20                  **on the system?**

21   **A**Most of the distribution system is shared by multiple customers. It is the  
22                  maximum simultaneous demand of all customers using a shared piece of  
23                  equipment that drives the costs associated with shared equipment, not an

1 individual customer's maximum demand during any hour of the day. For  
2 example, if a customer's peak demand occurs at 2 am, this demand likely has little  
3 impact on distribution capacity needs because overall demand is low during  
4 overnight hours.

5 **Q Is it appropriate to use non-coincident demand as a cost allocator in a cost-**  
6 **of-service study?**

7 **A** Yes, the diversified maximum non-coincident demand of a class of customers  
8 measures the maximum simultaneous demand of that class. This is a fairly  
9 reasonable approximation of the costs imposed by the class as a whole on the  
10 distribution system. However, this class non-coincident peak allocator is distinct  
11 from the sum of individual customers' maximum demands, which can occur at  
12 any time.

13 To clarify, class non-coincident peak demand is a reasonable cost allocator for  
14 most distribution system costs in a cost-of-service study, but an individual  
15 customer's non-coincident demand is generally *not* reasonable as an element in  
16 rate design. This is because a customer's individual non-coincident peak demand  
17 may occur at an entirely different time than the class non-coincident peak  
18 demand.

19 **Q Are there any costs that are appropriate for recovery through a non-**  
20 **coincident demand charge in rates?**

21 **A** Non-coincident demand charges may be appropriate for the recovery of  
22 distribution equipment that is sized specifically to meet an individual customer's  
23 maximum demand whenever that occurs (e.g., a transformer sized specifically to a  
24 customer's individual demand). However, non-coincident demand charges are not  
25 appropriate for recovering costs associated with equipment that is shared by  
26 multiple customers, such as feeders and substations.

1 **Q** **Are there rate designs that are more cost-reflective than non-coincident**  
2 **demand charges?**

3 **A** Yes. There are two primary alternatives: time-limited demand charges and time-  
4 varying volumetric rates.

5 A time-limited demand charge that applies only during certain hours of the day  
6 reflects costs on the system more accurately, as it is assessed only during hours in  
7 which the system tends to be stressed. For example, if DEK's feeder and  
8 substations typically peak between the hours of 4 pm and 8 pm, a demand charge  
9 might be designed to only apply during these hours. This would more closely  
10 approximate a customer's contribution to distribution capacity costs than a non-  
11 coincident demand charge. Indeed, this is the type of demand charge that the  
12 Company currently uses.

13 An even better alternative is the use of time-varying volumetric charges. Whereas  
14 a demand charge only measures a customer's highest demand during the month, a  
15 time-varying rate also accounts for the duration of that demand. Accounting for  
16 the length of time that a customer uses shared equipment is important, as that  
17 impacts the ability of other customers to also use that equipment. Consider two  
18 customers using the same piece of distribution equipment:

- 19 • Customer A typically uses 300 kW but experiences occasional, brief bursts of  
20 demand to 600 kW.  
21 • Customer B's demand is typically 600 kW but occasionally falls to 300 kW.

22 In this example, both customers would face a demand charge based on 600 kW of  
23 demand. However, the system may be able to accommodate many customers with  
24 demands similar to Customer A if the timing of the customers' peak demands are  
25 fairly staggered. That is, there is likely to be greater diversity of demand on the  
26 system for customers with load similar to Customer A. In contrast, the distribution

1 system would likely not be able to accommodate as many customers with  
2 demands similar to Customer B, because the maximum demands of such  
3 customers would be more likely to overlap. In other words, because Customer B  
4 uses 600 kW of demand more regularly, there is less potential for load diversity to  
5 accommodate multiple customers.

6 By accounting for the volume of usage of a customer during hours when the  
7 system is stressed, a time-varying volumetric rate better reflects the fact that  
8 Customer B imposes demands of 600 kW on the distribution system far more than  
9 Customer A, thereby precluding other customers from using the same equipment.  
10 Unlike volumetric rates, a demand charge cannot account for this.

11 Finally, I note that non-coincident demand charges simply encourage customers  
12 to spread their charging evenly over the course of the day. This could have the  
13 perverse incentive of encouraging some charging to shift from off-peak to on-  
14 peak hours to flatten demand, despite the system facing capacity constraints only  
15 during on-peak hours.

16 **Q Why do you claim that non-coincident demand charges would create**  
17 **additional barriers to transportation electrification?**

18 **A** The addition of a demand charge to Rate DT would substantially increase costs  
19 for public DCFC and fleet customers. In particular, DCFC stations frequently  
20 experience low load factors, where the quantity of electricity consumed (kWh) is  
21 low but the demand (kW) is high. For low-load-factor DCFC customers, demand  
22 charges tend to dominate customers' electric bills and make it difficult to earn  
23 sufficient revenue to cover their costs.<sup>109</sup> Access to fast-charging infrastructure is

---

<sup>109</sup> See, e.g., Fitzgerald, Garrett, and Chris Nelder. DCFC Rate Design Study, Rocky Mountain Institute, 2019, *available at* <http://www.rmi.org/insight/DCFC-rate->

1 critical for reducing “range anxiety” and supporting transportation electrification.  
2 Range anxiety is of particular concern in rural parts of the state. It is also  
3 important to enable EV adoption among customers without access to at-home  
4 charging (such as those living in apartment buildings).

5 Likewise, medium- and heavy-duty EVs (such as buses and freight trucks) may  
6 require fast-charging capabilities to quickly recharge their large capacity batteries  
7 between routes. Again, these customers may have low load factors, particularly in  
8 the early days of fleet electrification. Because demand charges would  
9 disproportionately increase bills for low-load-factor customers, they may make  
10 electrification of fleets uneconomic and impede adoption of medium- and heavy-  
11 duty EVs. Lower adoption of medium- and heavy-duty vehicles also has equity  
12 implications, as lower-income customers are more likely to utilize public transit  
13 and live in communities that suffer from high levels of air pollution from vehicle  
14 operations.

15 **Q What does your analysis show regarding the potential impacts on customers’**  
16 **bills from the Company’s proposed additional demand charge for Rate DT?**

17 The additional distribution demand charge proposed for Rate DT will  
18 disproportionately increase bills for owners of DCFC stations and large EV fleets,  
19 relative to the rest of the class, while also discouraging off-peak charging (Table  
20 4). I estimated the bill impacts for hypothetical customers with public DCFC  
21 stations or EV fleets. For customers who charge the EVs during both on and off

---

designstudy; and Garrett Fitzgerald and Chris Nelder, EVgo Fleet and Tariff Analysis, Rocky Mountain Institute, Mar. 2017, available at [www.rmi.org/wpcontent/uploads/2017/04/eLab\\_EVgo\\_Fleet\\_and\\_Tariff\\_Analysis\\_2017.pdf](http://www.rmi.org/wpcontent/uploads/2017/04/eLab_EVgo_Fleet_and_Tariff_Analysis_2017.pdf).

1 periods, their effective rate (\$/kWh)<sup>110</sup> increased an additional 19 to 29 percent  
2 more than the class average rate increase.<sup>111</sup> In other words, owners of public  
3 DCFC stations or EV fleets are impacted disproportionately relative to the rest of  
4 the rate class.

5 More specifically, the effective cost of electricity for a DCFC station with a 5%  
6 load factor would increase from \$0.44/kWh to \$0.62/kWh. For customers who  
7 primarily charge off-peak and who were previously benefitting from low demand  
8 charges during that period, the effective rates would more than double due to the  
9 addition of the non-coincident demand charge. These customers could expect an  
10 effective rate increase of between 66 percent and 97 percent over the class  
11 average rate increase. The fact that customers who charge primarily off-peak  
12 would see the largest percentage rate increases is particularly alarming, given the  
13 Company's purported focus on minimizing costs associated with EV charging.

---

<sup>110</sup> The total effective rate is the total bill divided by the total kWh of a customer (in other words, it is a measure of all charges on a per kWh basis).

<sup>111</sup> Direct Testimony of Bruce L. Sailors, Attachment BLS-1, pg. 33.

1

**A** I recommend that the Commission reject the Company’s proposed modifications to Rate DT and require the Company to maintain the use of time-varying volumetric rates for the recovery of distribution costs, rather than shifting these costs into a non-coincident demand charge. The introduction of a non-coincident demand charge would poorly reflect cost causation, reduce incentives to charge during off-peak hours, and would undermine transportation electrification for DCFC customers and medium- and heavy-duty fleets.

21

**Q What changes does the Company propose regarding Rider LM?**

22  
23  
24

**A** The Company proposes to change the measurement of billed demand for Rider LM for Rates DS and DP (Distribution Secondary and Distribution Primary for customers with demand <500 kW). Currently Rider LM measures billed demand

1 only during on-peak hours. The Company’s proposal would change the definition  
2 of billed demand to be the greater of demand measured during on-peak hours or  
3 50 percent of off-peak hours.

4 **Q Please explain your concerns regarding the application of the demand charge**  
5 **to off-peak hours for Rider LM.**

6 **A** My concerns hinge on the fact that including off-peak hours in the tariff would  
7 result in customers paying too much for charging during off-peak hours, resulting  
8 in lower adoption of EVs and inefficient use of the system.

9 As discussed above for Rate DT, the costs associated with shared distribution  
10 system equipment are driven by the maximum simultaneous demand of multiple  
11 customers, not individual customers. During off-peak hours, system demand is  
12 low, leaving substantial spare capacity to serve off-peak load. Further, the terms  
13 and conditions in the tariff state, “The Company shall not be required to increase  
14 the capacity of any service facilities in order to furnish off peak demands,” which  
15 protects the Company from customers imposing excessive demand during off-  
16 peak hours without paying for any necessary upgrades to serve that demand. In  
17 sum, the Company’s proposal would result in customers paying too much for off-  
18 peak EV charging. This in turn would raise the costs of fleet electrification for  
19 customers who charge during off-peak hours and it would slow transportation  
20 electrification in general.

21 In addition, the Company’s proposal would result in less efficient use of the  
22 system. Specifically, a demand charge that applies during off-peak hours would  
23 reduce the incentive for customers to shift as much load to off-peak hours as  
24 possible. Instead, customers would face a perverse incentive to shift some  
25 charging from off-peak to on-peak hours to create a flatter load profile, despite the  
26 system facing capacity constraints only during on-peak hours.

1 **Q** What does your analysis show regarding the potential impacts on customers’  
2 bills from the Company’s proposed changes to Rider LM?

3 **A** The proposed change to Rider LM impacts customers with EV fleets who  
4 primarily charge during off-peak hours. I calculated the impact of the proposed  
5 changes for two example customers with EV fleets. As can be seen in Table 5, on  
6 average, the proposed Rider LM results in a 50-percent increase in total effective  
7 rate (in \$/kWh). The average 50-percent increase is substantially larger than the  
8 proposed class rate increase<sup>112</sup> of 15.9 percent and 13.1 percent for Rates DS and  
9 DP, respectively.

10 **Table 5. Comparison of proposed Rider LM to current Rider LM (effective rate, \$/kWh),**  
11 **for commercial customers with an EV fleet**

Rate	Example Customer	Effective Rate \$/kWh		% Change
		Current Rider LM	Proposed Rider LM	
DS	School Bus Fleet	\$0.08	\$0.12	59%
DP	School Bus Fleet	\$0.07	\$0.12	63%
DS	Medium-Duty Vehicle Fleet	\$0.09	\$0.12	37%
DP	Medium-Duty Vehicle Fleet	\$0.08	\$0.12	49%

12 *Source: Direct Testimony of Bruce L. Sailors, Attachment BLS-1, pg. 3 (Rate DS), pg. 5 (Rate*  
13 *DP), pg. 22 (Rider LM). Analysis only includes base rates, including customer charge, for Rates*  
14 *DS and DP (with Rider LM), but does not include any additional riders or taxes. Load curves for*  
15 *tractor trailer and school bus customers based on LBNL HEVI-Pro, modified to reflect lower load*  
16 *diversity of individual sites (Lawrence Berkeley National Laboratory, “HEVI-Pro load profiles,”*  
17 *provided to Synapse Energy Economics in August 2022). Assumes 10 vehicles per fleet, with 100%*  
18 *off-peak charging, and no additional monthly load.*

19 **Q** What do you recommend regarding Rider LM?

20 **A** I recommend that the Commission reject the Company’s proposed modification to  
21 Rider LM and require the Company to maintain the application of demand

---

<sup>112</sup> Direct Testimony of Bruce L. Sailors, Attachment BLS-1, pg. 33.

1 charges under Rider LM to on-peak hours only, as this would be more cost-  
2 reflective and better support transportation electrification.

3 **Q Does this conclude your testimony?**

4 **A** Yes.
