This report was prepared by the Division of Ratepayer Advocates (DRA) of the California Public Utilities Commission (Commission) in R.06-02-013 proceeding. In this docket, the IOUs, Pacific Gas and Electric Company (PG&E), Southern California Edison (SCE), and San Diego Gas and Electric Company (SDG&E), request that the Commission to approve their Long Term Procurement Plans (LTPP) for the period of 2007-2016. In this report DRA presents its analysis and recommendations associated with the Investor Owned Utilities' (IOU) requests.

Sepideh Khosrowjah served as DRA's project coordinator in this review, and is responsible for the overall coordination in the preparation of this report.

1 **I. SUMMARY OF RECOMMENDATIONS**

2 SCE presents two candidate plans in its Long Term Procurement Plan  
3 (LTPP), a “Required Plan” and a “Best Estimate” plan (“proposed plan” or  
4 “recommended plan”). SCE considers the Best Estimate Plan to have the best  
5 combination of reliability and cost performance and recommends that the  
6 Commission adopt it.

7 DRA has specific comments and recommendations regarding SCE’s  
8 estimates of its need for resources and availability of preferred resources and its  
9 procurement strategy for certain resources.

10 **A. Estimates of Need and of Availability of Preferred**  
11 **Resources**

12 **Need.** SCE estimates that under its recommended plan it would need to  
13 procure a cumulative total of approximately 15,400 MW by 2016 to meet the  
14 requirements of its bundled customers (contractual procurement). It also estimates  
15 that by 2016 there would be a need for approximately 1,340 MW in SP-26 to meet  
16 reserves requirements, of which SDG&E would be responsible for 80% for its  
17 service territory (physical procurement).

18 DRA recommends that SCE adjust its estimate of need by calculating it  
19 using energy efficiency and DR forecasts consistent with Commission targets, as  
20 well as using expected operating conditions rather than adverse operating  
21 conditions to determine the need for physical capacity. This recommendation  
22 reflects continued use of Commission guidelines regarding planning assumptions  
23 until SCE presents a compelling case for using more stringent assumptions and our  
24 recommendations regarding reasonable planning assumptions for EE and DR. .If  
25 SCE estimates its needs using those assumptions, the quantity of contractual  
26 capacity and physical capacity required by 2016 is lower. For example, the  
27 contractual procurement would decline by approximately 800 MW (5%) and the

1 physical procurement by 700 MW (55%).

2 **Energy Efficiency.** DRA recommends that the Commission reject the  
3 assumptions regarding energy efficiency potential that SCE used in its Best  
4 Estimate Plan. Instead we recommend that the Commission require SCE to only  
5 use energy efficiency savings goals established in prior Commission Decisions in  
6 its procurement scenarios.

7 **Demand Response.** DRA recommends that SCE adjust its recommended  
8 plan to reflect the position that all Commission-approved programs are cost-  
9 effective as well as to use “Best Estimates” of MW reductions for all DR programs  
10 in the near-term and for reliability DR programs for 2009-2016. It should also  
11 ramp-up price-responsive DR to the full 5% goal during the first summer after the  
12 “full deployment” year of AMI in 2013. These assumptions are reasonable for  
13 planning purposes given the numerous initiatives underway to increase the  
14 availability of DR.

15 **Other Generation Resources.** SCE proposes to increase its procurement  
16 limits by 1,950 MW to provide insurance against uncertainties such as unexpected  
17 loss of capacity or greater than expected load growth. DRA recommends that the  
18 Commission defer consideration of this proposal until such time as SCE submits  
19 an adequate level of supporting documentation and analysis.

20 **B. Procurement strategy**

21 **Renewable resources.** DRA recommends that the Commission require  
22 SCE to fully analyze renewable generation ownership options as resource plan  
23 candidates, either in a compliance filing in this proceeding or for the next LTPP.  
24 These recommendations are consistent with the Commission desire, expressed in  
25 D.04-12-048, that IOUs evaluate the full range of procurement options.

26 **Other Generation resources.** SCE is proposing to procure significant  
27 quantities of conventional generation to meet the projected requirements of

## REDACTED VERSION

1 bundled customers, i.e. contractual needs, and of its service territory, i.e., physical  
2 needs over the 2007 to 2009 planning horizon. SCE does not need the majority of  
3 this capacity until well after 2008, when it will have to defend its 2008 LTPP. As  
4 outlined in our general position on procurement, there are several reasons why the  
5 Commission should only approve those physical procurements that SCE must  
6 initiate prior to the next LTPP because of procurement or construction lead times.  
7 SCE has the opportunity to provide that information in its reply testimony in this  
8 proceeding. There are also benefits associated with phasing in a laddered portfolio  
9 for its contractual procurements.

10 DRA recommends that the Commission only approve physical  
11 procurements for which SCE has identified needs in light of the corresponding  
12 procurement and construction lead times, and that it only approve contractual  
13 procurements for which SCE has identified needs prior to the next LTPP  
14 consistent with procurement lead times and with the phasing in of a laddered  
15 portfolio.

16

## 17 **II. INTRODUCTION**

18 Southern California Edison (SCE) filed its Long Term Procurement Plan  
19 (LTPP) on December 11, 2006. In that filing SCE presents two candidate plans, a  
20 “Required Plan” and a “Best Estimate” plan. SCE requests that the Commission  
21 adopt its Best Estimate Plan (“proposed plan” or “recommended plan”).

22 On February 2, 2007, SCE filed an amendment to its LTPP indicating  
23 various corrections and updated figures.

24 The purpose of this volume is to assess whether SCE’s Long Term  
25 Procurement Plan (LTPP) is reasonable. In order to make this assessment, DRA  
26 has considered SCE’s proposals in the context of the Commission’s direction as to  
27 how SCE is to incorporate Commission policies into its LTPP. As the

## REDACTED VERSION

1 Commission notes in its scoping memo, this is an umbrella proceeding. “One of  
2 the primary goals of this rulemaking is to serve as the Commission’s forum to  
3 **integrate** all procurement policies and related programs.”<sup>1</sup> (**emphasis added**)

4 The Commission clearly states its directive to the IOUs in its scoping memo

5 This proceeding will not be a place to relitigate the targets already  
6 established elsewhere. Instead, any problems concerning goals or targets  
7 established in other Commission proceedings will be addressed and  
8 resolved in the appropriate proceeding – not in this proceeding.<sup>2</sup>

9 Accordingly, DRA does not intend to debate policy issues within this LTPP  
10 proceeding.

11 This volume presents DRA’s assessment of the extent to which the LTPP  
12 filed by SCE complies with Commission policies and the guidelines set out in the  
13 Assigned Commissioner’s Ruling and Scoping Memo (ACR/Scoping Memo)  
14 issued on September 25, 2006. Our assessment is organized according to the  
15 outline specified in the ACR/Scoping Memo for consistency and ease of cross-  
16 references. However, the assessment is primarily limited to those aspects of  
17 SCE’s LTPP where we have concerns or a disagreement.

18

### 19 **III. PROCUREMENT IMPLEMENTATION PLAN**

20 Based upon the information we have reviewed to date we do not disagree  
21 with this aspect of SCE’s LTPP.

### 22 **IV. LONG-TERM PROCUREMENT RESOURCE PLAN** 23 **2007-2016**

24 This section begins by summarizing SCE’s recommended procurement  
25 resource plan. We then present our proposed adjustments to that plan in light of

<sup>1</sup> ACR and Scoping Memo on the Long Term Procurement Phase of R.06-02-013, p. 16

<sup>2</sup> Ibid, p. 18

**REDACTED VERSION**

1 our assessment of SCE’s positions regarding energy efficiency and demand  
2 response.

3 **A. SCE’s Recommended Plan**

4 SCE recommends that the Commission adopt SCE’s “Best Estimate Plan”.<sup>3</sup>

5 The plan is based on procurement for meeting a 15% Planning Reserve Margin  
6 (PRM) and SCE’s 1-in-2 demand forecast. The plan includes the following:

- 7 • Investing in level of Customer Energy Efficiency (CEE) that is based on an  
8 analysis of the maximum reliably-achievable potential rather than the  
9 Commission’s targets<sup>4</sup>;
- 10 • Implementation of the California Solar Initiative (CSI) to 75% of the  
11 targets (about 600 MW by 2016)<sup>5</sup>;
- 12 • Because of SCE’s large portfolio of interruptible Demand Response (DR)  
13 programs, SCE will exceed the 5% DR target in all years; however, the  
14 plan assumes price-sensitive DR levels that are justifiable with the  
15 implementation of the AMI program and not the Commissions targets<sup>6</sup>;
- 16 • Procuring renewable resources to meet the Renewable Portfolio Standard  
17 (RPS) of 20% by 2011<sup>7</sup>;
- 18 • Procuring the following quantities of other generation supply resources by  
19 2016 to meet bundled customer requirements:
  - 20 ○ Up to 2,250 MW of baseload products;
  - 21 ○ Up to 4,000 MW of shaping and peaking products;
  - 22 ○ Up to 5,650 MW of super-peaking capacity products; and
  - 23 ○ Up to 3,500 MW of seasonal super-peaking capacity products<sup>8</sup>; and,

<sup>8</sup> Generic capacity needs to “meet bundled customer requirements” from SCE 2006 LTPP, Vol.

(continued on next page)

**REDACTED VERSION**

- 1       • Procuring up to 1,300 MW of new capacity in SP-26 by 2016, of which  
2       SCE is responsible for 80% or 1,070 MW, in order to meet physical needs.  
3       That procurement is based on the Company’s 1-in-10 demand forecast and  
4       a 5% operating reserve margin. Prior to 2013 there does not appear to be a  
5       need for new capacity in SP-26<sup>9</sup>.

6       SCE prefers the Best Estimate Plan because it considers that plan to have  
7       better cost and reliability metrics than the Required Plan. According to SCE the  
8       Required Plan would be overly expensive and not feasible. While the CO<sub>2</sub>  
9       emissions are higher in the Best Estimate Plan, according to SCE the incremental  
10      cost of achieving the incremental emission reductions of the Required Plan is  
11      prohibitive<sup>10</sup>.

12      SCE proposes to increase capacity margin procurement limits by 1,950  
13      MW to account for an N-1 contingency loss and higher than projected load  
14      growth<sup>11</sup>.

15      The resource mix associated with the proposed plan is shown in Figures C -  
16      IV.1 and C - IV.2.

6 **B. DRA Adjustments to Proposed Plan**

7 We are proposing several adjustments to the quantities of contractual and  
8 physical capacity that SCE needs to procure under its recommended plan. These  
9 adjustments result from the application of the following assumptions:

- 10 • The use of energy efficiency forecasts consistent with Commission targets.  
11 The justification for that adjustment is presented in section IV-C below.
- 12 • The use of DR forecasts consistent with Commission targets. The  
13 justification for that adjustment is presented in section IV-D below;
- 14 • Adjustments to the PRM to reflect the impact of the preceding energy  
15 efficiency and DR adjustments; and
- 16 • The use of expected operating conditions, rather than adverse operating

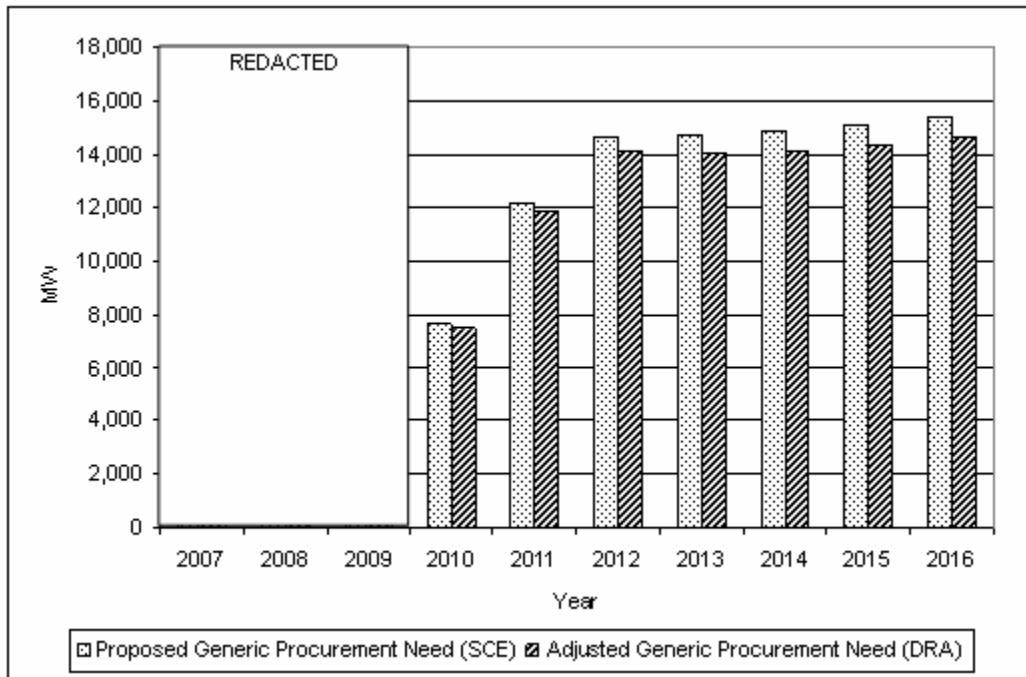

1 conditions, to determine the need for physical capacity.

2 **1. Contractual Procurement**

3 The quantity of capacity that SCE needs to procure to meet bundled  
4 customer needs is overstated. This overestimate arises from the fact that SCE's  
5 estimate of needs is based on forecasts for energy efficiency and DR that are  
6 below Commission targets. These forecasts are discussed below in sections IV.C  
7 and IV.D. Applying the Commission's targets for energy efficiency and DR  
8 results in a reduction in bundled customer procurement need of approximately  
9 1,000 MW by 2016. The impact of those adjustments is presented in Figure C –  
10 IV.3 and Table C - IV.1.

10  
11  
12  
13  
14

The quantity of capacity that SCE needs to procure to meet the requirements within its service territory is also overstated. This overestimate arises from the fact that SCE's estimate of those needs is based on forecasts for DR that is below Commission targets and on "adverse" conditions rather than expected operating conditions. These adjustments are discussed below and summarized in Figure C – IV.4 and Table C - IV.2. The impact of these adjustments is to reduce the quantity of new capacity required in SP-26 by 2016 from 1,340 MW to 608 MW.

**Table C – IV.2  
SCE Proposed Service Area Requirements and DRA Proposed  
Adjustments, 2016**

Reserves	Proposed Need to Meet Service Area Requirements in 2016 (MW)		
	SCE Proposed Need	DRA Proposed Need	DRA Adjustment - Reduction <sup>3</sup>
Operating Reserves (5%) <sup>1</sup>	1,340	(1,554)	2,894
Planning Reserves (15%) <sup>2</sup>	526	486	40

<sup>1</sup> SCE proposed operating reserve needs based on adverse conditions (SCE 2006 LTPP, Vol. 1B, p. 31, Table IV-7, line 24);  
DRA proposed operating reserve needs based on expected conditions.  
<sup>2</sup> SCE proposed planning reserve needs based on expected conditions (SCE 2006 LTPP, Vol. 1B, p. 31, Table IV-7);  
DRA proposed operating reserve needs reflect adjustments for DR accounting.  
<sup>3</sup> Difference shown as SCE proposed need minus DRA proposed need.

SCE determines the quantity of capacity it must procure to meet the requirements within its service territory, physical procurement, based on an assessment of capacity required for planning reserves and its operating reserves. Planning reserves are calculated as the difference between demand, adjusted for demand response program peak savings, and supply resources, including import capability. Operating reserves include an adjustment to supply resources to account for outages (average forced and planned). SCE determines the capacity it must procure to satisfy the higher of capacity needed to maintain planning reserves or capacity needed to maintain operating reserves

SCE’s determination of the quantity of capacity it requires to meet physical need is overstated for several reasons.

- First, when calculating the operating reserves, SCE accounts for DR resources on the supply side, but does not include any reserve adjustment for DR to account for the fact that DR is actually a demand side resource. Applying a 5% reserve credit to DR resources results in a reduction in physical need of approximately 130 MW in 2016.<sup>12</sup>
- Second, SCE bases its estimate of capacity to meet operating reserves based upon a 5% operating reserve margin under adverse conditions. This

---

<sup>12</sup> Based on 2,585 MW of price responsive and interruptible DR times 5%; DR capacity value from SCE 2006 LTPP, Vol. 1B, p. 31, Table IV-7.

1 includes an adjustment to total demand for a 1-in-10 summer temperature  
2 demand, an assumption of higher than average outages (by one standard  
3 deviation, or 560 MW) and an assumption of higher than normal zonal  
4 transmission limitations. SCE does not provide a justification for basing its  
5 estimate on these adverse conditions rather than on expected operating  
6 conditions. (SCE presents an alternative estimate assuming expected  
7 operating conditions, but that assessment does not account for DR  
8 resources at all, and is based on a 7% operating reserve margin.)

9 If one estimates SCE's requirements for operating reserves based upon a  
10 correct accounting of DR resources and expected operating conditions, there is no  
11 need for additional capacity in the SP26 region over the entire planning period  
12 based on a 5% operating reserve margin.

13 According to SCE's planning reserve assessment, there is a need for  
14 approximately 658 MW of new physical capacity by 2016. However, this  
15 assessment for the SP26 region is also high due to improper accounting for DR  
16 resources (by about 50 MW)<sup>13</sup>. If one estimates SCE's requirements for planning  
17 reserves based upon a correct accounting of DR resources this requirement  
18 declines to 608 MW in SP26.

## 19 C. Energy Efficiency (EE)

### 20 1. Background

21 In its section on Energy Efficiency in its LTPP SCE states that it is  
22 presenting two candidate long-term procurement plans: 1) Required Plan; and 2)

---

<sup>13</sup> SCE calculates the planning reserve margin appropriately by using the following formula: Reserve Margin = ((Total Generation Capacity)/(Total Demand - DR savings) - 1). SCE then multiplies the Total Demand by the difference between the reserve margin as calculated in the above formula and 15% to calculate planning resource needs: Reserve Needs = (Total Demand) x (Reserve Margin - 15%) The proper formula for calculation of reserve needs should account for DR savings as follows: Reserve Needs = (Total Demand - DR Savings) x (Reserve Margin - 15%).

1 Best Estimate Plan.<sup>14</sup> The Required plan incorporates energy efficiency savings  
2 goals as directed by the Commission’s Energy Efficiency goals decision (D.04-09-  
3 060) for program planning, years 2006 and beyond. SCE’s Best Estimate Plan  
4 uses its own analysis<sup>15</sup> to determine the energy efficiency potential achievable in  
5 its service territory, which is much lower than the commission adopted goals.<sup>16</sup>

6 SCE, in collaboration with the other IOUs, undertook a statewide analysis  
7 of energy efficiency potential to forecast the “maximum reliable-achievable”  
8 energy efficiency<sup>17</sup>. The study was performed by Itron and KEMA and managed  
9 by Pacific Gas and Electric (PG&E).<sup>18</sup> In the plan’s sections on energy efficiency  
10 SCE cites this report as the basis for its inability to attain the level of energy  
11 efficiency savings beyond 2008 required by the Commission.

## 12 **2. Energy Efficiency Recommendations**

### 13 **(a) The Commission Should Only Use Energy** 14 **Efficiency Savings Goals Established in** 15 **Previous Commission Decisions for All SCE** 16 **Procurement Scenarios**

17 Commission direction is very clear that the energy efficiency savings  
18 targets established in previous Commission decisions are to be incorporated into  
19 SCE’s long-term procurement plan.

---

<sup>14</sup> SCE Application Volume I, Section V. p.69

<sup>15</sup> Ibid., p. 69

<sup>16</sup> This applies to “uncommitted” savings for years 2009-2016. Commission-adopted savings for 2006-2008 are embedded in the CEC Demand forecast (CEC-400-2005-034-SF-ED2, page 1-15) and cannot be modified by the IOUs.

<sup>17</sup> Ibid., p. 69

<sup>18</sup> California Energy Efficiency Potential Study/Itron, Volume 1, May 24, 2006, p. 1-1; California Industrial Existing Construction Energy Efficiency Potential Study/KEMA, Volume 1, p. 1-1.

**REDACTED VERSION**

1           The LTPP scoping memo states that,

2                   “...the 2006 LTPPs will need to reflect all of the  
3                   procurement-related decision made by the Commission  
4                   to date in all other procurement-related dockets.”<sup>19</sup>

5           Previously, in its energy efficiency goals decision, the Commission  
6 affirmed that,

7                   “...the energy efficiency savings goals adopted in this  
8                   proceeding should be fully reflected in the IOUs  
9                   resource acquisition and procurement plans...”<sup>20</sup>

10          Furthermore, the Energy Efficiency goals decision orders that,

11                   “For the procurement plans that will be filed in 2006  
12                   and during subsequent procurement plan cycles, or for  
13                   any updating to the long-term procurement plans  
14                   required by the commission before then, PG&E,  
15                   SDG&E and SCE shall incorporate the most recently-  
16                   adopted energy savings goals into those filings.”<sup>21</sup>

17          As noted above in this section and in the previous sections, the Commission  
18 expressly states its intent for SCE to incorporate only the most recently adopted  
19 energy savings goals into its long-term procurement plan. The Commission,  
20 therefore, should not consider any other energy efficiency assumptions in the  
21 context of this Long-term Procurement Proceeding.

22

23                   **(b) The Commission Should Reject SCE’s**  
24                   **Energy Efficiency Potential Best Estimate**  
25                   **Plan Assumptions**

26          The Commission should not consider the citing of SCE’s own energy  
27 efficiency potential study as the basis for allowing SCE to use goals other than

---

<sup>19</sup> ACR and Scoping Memo on the Long Term Procurement Phase of R.06-02-013, September 25, 2006, p. 17.

<sup>20</sup> D.04-09-060. Conclusion of Law #3, p. 50

<sup>21</sup> D.04-09-060, Ordering Paragraph #6, p. 53

**REDACTED VERSION**

1 those directed by Commission decision D.04-06-060. If SCE has concerns about  
2 its energy efficiency savings targets, it should appropriately address them within  
3 the parameters of the energy efficiency proceeding, as noted above. As SCE  
4 points out in its filing, Energy Division (ED) has a process in place to update the  
5 energy efficiency potential savings goals as part of the planning process for the  
6 2009 – 2011 energy efficiency portfolios.

7 The Commission intends to review the IOU energy efficiency goals on a  
8 regular basis and update them as warranted.

9 “These goals shall be updated every three years for use  
10 in the subsequent program cycles. In preparation for  
11 the PY2009-PY2011 program cycle, Energy Division  
12 and California Energy Commission staff (“Joint  
13 Staff”) shall jointly prepare recommendation for  
14 adjustments to today’s adopted savings goals as  
15 appropriate, based on updated savings potential  
16 studies, accomplishment data, changes to mandatory  
17 efficiency standards and other evaluation studies and  
18 factors that staff deems appropriate.”<sup>22</sup>

19

20 Thus, any concern on the part of SCE about the achievability of future  
21 energy efficiency savings targets has a defined forum within the context of the  
22 energy efficiency proceeding to address them. The potential study that SCE cites  
23 is their own interpretation of what savings are achievable and has not been vetted  
24 through a formal Commission process. It is essential to go through such a public  
25 process and review in order to understand the assumptions of SCE’s potential  
26 study compared with those of the Commission-led study, where other parties can  
27 participate on the record.

28 SCE notes in its long-term procurement plan section on Energy Efficiency

---

<sup>22</sup> D.04-09-060, Energy Efficiency Goals Decision, p. 52.

**REDACTED VERSION**

1 that it has expressed concern numerous times during the 2006-2008 goals decision  
2 process.<sup>23</sup> Yet the Commission expressly denied SCE’s request to use its own  
3 long-term planning goals for energy efficiency. In that goals decision, the  
4 Commission stated,

5 “We also reject the recommendation of SCE and  
6 SDG&E that we adopt the electric savings forecasts  
7 presented in the LTRP filings in R.04-04-003 in lieu of  
8 the Joint Staff recommendations. We note that the  
9 savings values presented in SCE’s and SDG&E’s  
10 LTRP filings are considerably less than the economic  
11 and maximum achievable savings potential estimates  
12 developed in the disaggregated study...”<sup>24</sup>

13  
14 At this time, based on lack of any record, DRA has no reason to believe  
15 that the Commission will find that current assigned energy savings targets for SCE  
16 are not attainable. The Commission has clearly defined its expectations for which  
17 energy efficiency assumptions to use in both the Long-Term Procurement and the  
18 Energy Efficiency proceedings. It also has a clearly defined and recurring process  
19 in place for updating the energy efficiency savings goals. DRA does not believe  
20 that it is appropriate to accept any energy efficiency scenario for SCE other than  
21 the Required Plan, which incorporates the Commission assigned savings targets.  
22 Accordingly, DRA has utilized only the Commission assigned energy efficiency  
23 numbers in SCE’s Required Plan and urges the Commission to use only these  
24 numbers as well.

<sup>23</sup> SCE Long Term Procurement Plan, Volume II, Energy Efficiency Section 1.a) p. 71.

<sup>24</sup> D.04-09-060, p. 41

1 **D. Demand Response**

2 **1. Recent Developments in Procurement Policy**

3 On January 25, 2007 the Commission issued an Order Instituting  
4 Rulemaking (OIR) R.07-01-041 on Demand Response (DR). That OIR could  
5 have an impact on the level of DR in PG&E's LTPP.

- 6 • First, the Commission stated that the OIR will set DR goals for 2008  
7 and beyond and will also clarify which DR programs can be counted  
8 towards meeting these goals. The current goals are set at 5% of  
9 utility's peak demand for price responsive day-ahead DR programs.  
10
- 11 • Second, the OIR states that the protocols to be developed in the OIR  
12 for DR Load Impact measurements will be incorporated in future  
13 RA proceedings.  
14
- 15 • Third, OIR also proposes to coordinate efforts so that DR resources  
16 are efficiently incorporated in the CAISO's wholesale markets. The  
17 OIR will consider modifications to existing retail (utility-controlled)  
18 DR programs to align them with CAISO's operational needs.  
19

20 **2. Discussion and Recommendations**

21 SCE presents a "Best Estimate" plan and a "Required Plan." The Best  
22 Estimate plan reflects realistic DR reductions SCE can be achieve, particularly in  
23 the near term and the mid-term time horizon. The Best Estimate plan, however,  
24 does not reflect Commission's 5% goal for price-responsive programs even over  
25 the long-term. The plan shows SCE reaching only 75% of the Commission's 5%  
26 goal in 2016. SCE's Required Plan, on the other hand, reflects Commission's 5%  
27 goal for price-responsive programs throughout 2007-2016. DRA believes neither  
28 the Best Estimate plan nor the Required Plan include realistic DR reductions that  
29 can be achieved throughout 2007-2016. For its Required Plan SCE simply

## REDACTED VERSION

1 assumes that beginning 2007 it will procure and meet its 5% goal – a totally  
2 unrealistic scenario.<sup>25</sup> Likewise, for its Best Estimate plan SCE assumes it will  
3 never reach its 5% goal during 2007-2016 – in DRA’s opinion a too pessimistic a  
4 scenario that prematurely gives up on meeting its 5% goal. DRA believes SCE  
5 could expand its price-responsive programs gradually corresponding to its AMI  
6 deployment and reach the 5% goal by 2013.

7 DRA proposes a procurement plan for SCE that reflects the following  
8 assumptions.

- 9 1. Use “Best Estimates” of MW reductions for all DR programs in the  
10 near-term for the current DR program cycle (2006-2008).
- 11 2. Use “Best Estimates” of MW reductions for reliability DR programs  
12 for 2009-2016.
- 13 3. Ramp-up price-responsive DR to the full 5% goal during the first  
14 summer after the “full deployment” year of AMI in 2013.
- 15 4. Assume all Commission-approved programs are cost-effective.

16

17 Attachment C - 3 shows DRA’s recommended resource procurement plan  
18 for SCE’s DR resources based on the above assumptions.

19

### 20 **E. Other Generation resources**

21 SCE proposes to procure 1,950 MW of capacity in addition to its projected  
22 needs to provide insurance against uncertainties such as unexpected loss of  
23 capacity or greater than expected load growth. Specifically, "SCE recommends  
24 adding the following margins to unmet, base case capacity requirements: 850 MW  
25 to the limit as an n-1 contingency for loss of generator Qualifying Capacity, and

---

<sup>25</sup> Based on SCE’s response to DRA’s Data Request R.06-02-013-Phase2-SCE-skg-2, SCE meets only a fraction (8% to 16%) of its 5% goal between 2007 and 2009.

1 1,100 MW due to load growth being higher than projected in the expected case."<sup>26</sup>

2 SCE has not provided any analyses demonstrating the probability of such  
3 events. Moreover, even if there is a reasonable probability of such an event, SCE  
4 has not provided any cost/benefit analysis to demonstrate that adding 1,950 MW  
5 of capacity is the most cost-effective option for addressing it.

6 **V. PROCUREMENT STRATEGY BY RESOURCE**

7 **A. Demand Response**

8 SCE's existing DR programs are described in its LTPP filing, Volume 1.  
9 These programs were authorized by the Commission in D.06-03-024.

10 Responding to the Commission's directives in August 2006, SCE proposed  
11 several enhancements to its existing DR programs. In D.06-11-049, the  
12 Commission approved, with changes, most of SCE's proposed enhancements.  
13 That decision also ordered SCE to file several advice letters to roll out several new  
14 and innovative DR programs: (1) A five-year term DR RFP; (2) A five-year term  
15 "Permanent Load Shifting" RFP; (3) A 2007 "AutoDR" proposal; and (4)  
16 Expansion of its AC cycling program. These programs fit into near-term and mid-  
17 term resource portfolio in DRA's recommended procurement plan for SCE. DRA  
18 believes SCE's AMI deployment beginning in 2009 and continuing through 2013  
19 will be a major impetus behind SCE reaching its 5 % goal for price-responsive  
20 programs in DRA's recommended procurement plan for SCE.

21

22 **B. Renewable Energy Procurement Strategy**

23 At least one IOU has highlighted the *potential* benefits of generation  
24 procurement under a utility-ownership framework, such as a turn-key contract or

---

<sup>26</sup> SCE 2006 LTPP, Vol. IA at 79-80.

## REDACTED VERSION

1 "Engineering, Procurement and Construction ('EPC') arrangements where the  
2 utility acts as the developer."<sup>27</sup> As PG&E points out, "The Commission has  
3 emphasized the importance of procurement flexibility to obtain the best resources  
4 for customers. For example, in D.04-12-048, the Commission lifted a ban on  
5 affiliate transactions for procurement concluding that 'it is in the best interest of  
6 ratepayers and consumers to allow for a full vetting of all available resources in an  
7 RFP.'"<sup>28</sup> SCE identifies various concerns relating to over-reliance on procurement  
8 of resources not built or owned by the utility.<sup>29</sup>

9 In general, utility ownership should be considered as a potentially cost-  
10 effective alternative for the procurement of renewable generation, especially when  
11 needed to meet RPS targets. Of particular interest in regard to non-fossil fuel  
12 technologies is that fact that, as SCE puts it, "A utility-owned project is dedicated  
13 to its customers' use over its entire lifecycle...By contrast, independent projects  
14 have a 'merchant tail' beyond the contract term, i.e., a hard expiration date. That is,  
15 the contract only provides benefits to utility customers for a fixed period of time,  
16 after which customers no longer have rights to the resource, and any remaining  
17 benefits accrue to the resource owner."<sup>30</sup> For renewable resources, it is reasonable  
18 to expect that the economic benefits of the project will be especially heavily  
19 loaded onto any such "tail." The Commission should require the IOUs to fully  
20 analyze renewable generation ownership options as resource plan candidates,  
21 either in a compliance filing in this proceeding or for the next LTPP.

1 **C. Other Generation Supply resources**

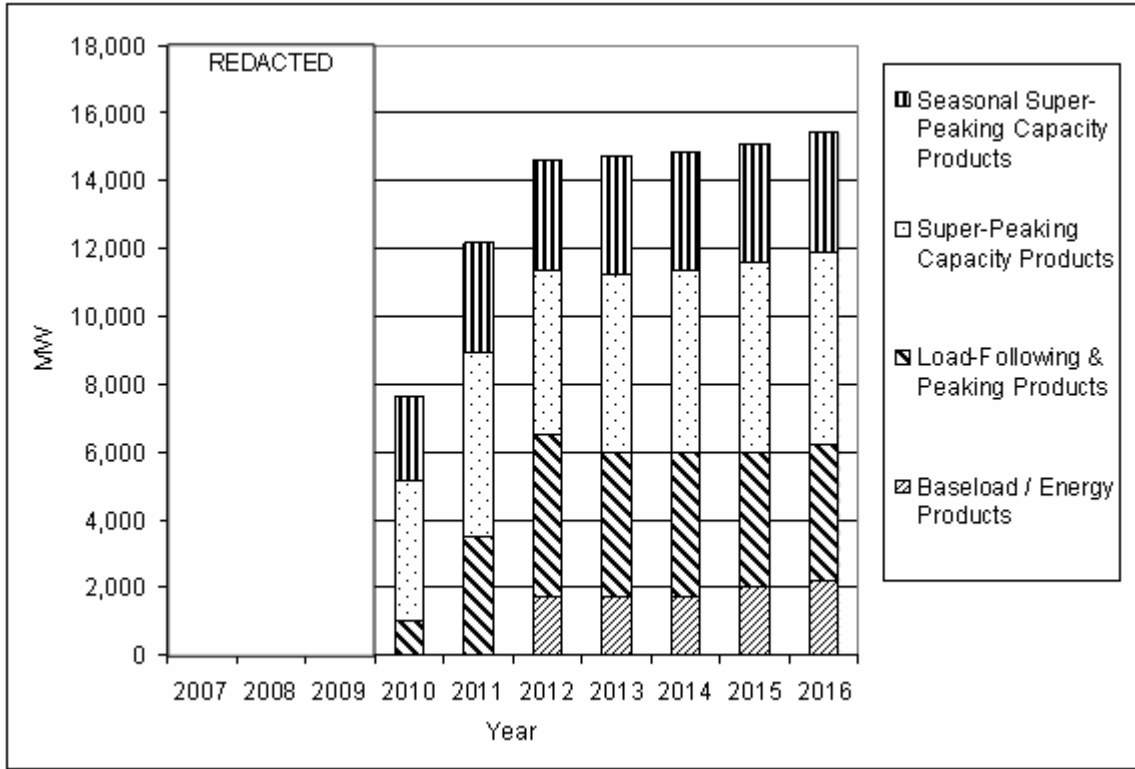

2 SCE is proposing to procure significant quantities of conventional  
3 generation to meet the projected requirements of bundled customers, i.e.,  
4 contractual needs, and of its service territory, i.e., physical needs.

5 **1. Procurements**

6 The types and quantities of projected procurements for bundled customers  
7 are presented in Figure C – V.1 and Table C - V.1. This table presents the  
8 estimated quantities needed to meet the open capacity requirement after  
9 accounting for procurement from preferred and planned resources. In order to  
10 represent the manner in which the utility procures capacity to meet fluctuating  
11 needs from year to year, this table was assembled as an illustrative example of  
12 how various capacity products could be added up to produce the utility’s proposed  
13 total in each capacity product category. Values in individual rows represent  
14 illustrative incremental additions and do not necessarily represent any specific  
15 proposed contracts.

2

3 **2. Discussion**

4 Tables C-V.1 and C-V. 2 indicate that SCE does not need the majority of  
 5 the capacity that it proposes to acquire over the 2007 – 2016 planning horizon  
 6 until well after 2008, when it will have to defend its 2008 LTPP. As outlined in  
 7 Volume A, there are several reasons why the Commission should only approve  
 8 those physical procurements that SCE must initiate prior to the next LTPP because  
 9 of procurement or construction lead times.

10 SCE has the opportunity to provide that information in its reply testimony  
 11 in this proceeding. Specifically it could indicate the specific procurements which  
 12 it believes must be pre-approved in this proceeding because of the lead times and  
 13 other relevant factors affect their timing. That filing should include sufficient  
 14 documentation to support Commission review and decisions concerning date of  
 15 need and procurement and construction lead times.

16 SCE is also faced with the need to procure a large quantity of contractual  
 17 capacity in 2008 and 2009, as indicated in Table C - V.1, above. This exposes  
 18 bundled service customers to considerable price risk as existing contractual  
 19 positions expire within a short time frame. As outlined in Volume A, there are  
 20 several reasons why SCE should seek to avoid such exposures in the future by  
 21 phasing in a ladder portfolio for its contractual procurements. Such a ladder  
 22 portfolio, would be composed of a group of positions, each covering a fraction of  
 23 the total need, but with staggered expiration dates. The result would be to limit the

1 fraction of bundled customer contractual need exposed to the market at any one  
2 point in time.

3 **3. Recommendations**

4 Approve contractual procurements for identified needs prior to the next  
5 LTPP consistent with procurement lead times and with the phasing in of a  
6 ladder portfolio.

7 Approve only physical procurements for identified needs in light of the  
8 corresponding procurement and construction lead times.

9

10 **VI. EVALUATION OF RESOURCE PLAN**

11 **A. Demand Response**

12 Although there is a lot of uncertainty about whether the IOUs will meet their  
13 5% goal for “price-responsive” programs or whether the Commission will allow  
14 IOUs to count reliability programs towards their 5% goal, DRA agrees with  
15 SDG&E argument in its LTPP filing that “holding room for these goals ensures  
16 that resource commitments to day do not foreclose the opportunities in these  
17 policy areas in the future.”<sup>31</sup> At the January 25, 2007 CAISO’s Market Issues  
18 Forum on DR, Commissioner Chong once again exhorted the utilities to increase  
19 the effectiveness and participation in their price-responsive DR programs to move  
20 closer to the 5% goal. DRA believes SCE’s AMI deployment, other technology-  
21 enabled DR programs (e.g. Auto DR, PCTs etc.) and time differentiated tariffs  
22 (e.g. CPP, RTP etc) could increasingly play an effective role in meeting the  
23 Commission’s 5% goal in future.
