7. Eversource’s GMP.....	44

1 **1. INTRODUCTION AND QUALIFICATIONS**

2 **Q Please state your names, titles, and employer.**

3 **A Woolf:** My name is Tim Woolf. I am a Vice President at Synapse Energy
4 Economics, located at 485 Massachusetts Avenue, Cambridge, MA 02139.

5 **Horowitz:** My name is Ariel Horowitz, PhD. I am a Senior Associate at Synapse
6 Energy Economics, located at 485 Massachusetts Avenue, Cambridge, MA
7 02139.

8 Synapse Energy Economics is a research and consulting firm specializing in
9 electricity and gas industry regulation, planning, and analysis. Our work covers a
10 range of issues, including economic and technical assessments of demand-side
11 and supply-side energy resources; energy efficiency policies and programs;
12 integrated resource planning; electricity market modeling and assessment;
13 renewable resource technologies and policies; and climate change strategies.
14 Synapse works for a wide range of clients, including state attorneys general,
15 offices of consumer advocates, trade associations, public utility commissions,
16 environmental advocates, the U.S. Environmental Protection Agency (EPA), U.S.
17 Department of Energy (DOE), U.S. Department of Justice, the Federal Trade
18 Commission, and the National Association of Regulatory Utility Commissioners.
19 Synapse has over 25 professional staff with extensive experience in the electricity
20 industry.

21 **Q Please summarize your professional and educational experience.**

22 **A Woolf:** Before joining Synapse Energy Economics, I was a commissioner at the
23 Massachusetts Department of Public Utilities (DPU) for four years. In that
24 capacity, I was responsible for overseeing a substantial expansion of clean energy
25 policies, including significantly increased ratepayer-funded energy efficiency
26 programs; an update of the DPU energy efficiency guidelines; the implementation

1 of decoupled rates for electric and gas companies; the promulgation of net
2 metering regulations; review and approval of smart grid pilot programs; and
3 review and approval of long-term contracts for renewable power. I was also
4 responsible for overseeing a variety of other dockets before the Commission,
5 including several electric and gas utility rate cases.

6 Prior to being a commissioner at the Massachusetts DPU, I was employed as the
7 Vice President at Synapse Energy Economics; a Manager at Tellus Institute; the
8 Research Director at the Association for the Conservation of Energy; a Staff
9 Economist at the Massachusetts Department of Public Utilities; and a Policy
10 Analyst at the Massachusetts Executive Office of Energy Resources.

11 I hold a Masters in Business Administration from Boston University, a Diploma
12 in Economics from the London School of Economics, and a BS in Mechanical
13 Engineering and BA in English from Tufts University. My resume, attached as
14 Exhibit CLF-TW/AH-2, presents additional details of my professional and
15 educational experience.

16 **Horowitz:** At Synapse, I have worked extensively on issues related to energy
17 system planning, data analysis, and the use of new technologies. My work has
18 included comments on integrated resource plans, as well as reports on and
19 modeling of policy-driven changes to the energy sector pertaining to Oregon,
20 Michigan, Puerto Rico, Connecticut, and the Regional Greenhouse Gas Initiative
21 member state region. I have provided consulting services for clients including: the
22 Energy Commission of Puerto Rico, U. S. EPA, the District of Columbia Office
23 of the People's Counsel, the Michigan Public Service Commission and
24 Department of Environmental Quality, multiple renewable energy developers, and
25 the Sierra Club.

26 I have provided expert analysis and testimony on issues related to utility planning,
27 revenue requirement, forecasting, and operations on behalf of the Energy
28 Commission of Puerto Rico.

1 I hold a Doctorate in Chemical Engineering from Tufts University as well as a BS
2 in Engineering from Swarthmore College. My research focused on design and use
3 of electrochemical energy storage technologies. My resume, attached as Exhibit
4 CLF-TW/AH-2, presents additional details of my professional and educational
5 experience.

6 **Q On whose behalf are you testifying in this case?**

7 **A** We are testifying on behalf of the Conservation Law Foundation (CLF).

8 **Q Have you testified previously in this docket?**

9 **A** No, we have not.

10 **Q What is the purpose of your testimony?**

11 **A** The purpose of our testimony is to address whether the Grid Modernization Plans
12 filed by Massachusetts Electric Company and Nantucket Electric Company d/b/a
13 National Grid (National Grid or the Company, in the National Grid-specific
14 chapter), Fitchburg Gas and Electric Light Company d/b/a Unitil (Unitil or the
15 Company, in the Unitil-specific chapter), NSTAR Electric Company and Western
16 Massachusetts Electric Company d/b/a Eversource Energy (Eversource or the
17 Company, in the Eversource-specific chapter) (together, the Companies) comport
18 with the Department's goals and directives for grid modernization.

19 **2. SUMMARY OF CONCLUSIONS AND RECOMMENDATIONS**

20 **Q Please summarize your primary conclusions.**

21 **A** In its orders on grid modernization which presaged these proceedings, the
22 Department indicated a clear preference for a broad and transformative
23 modernization of the electricity grid. The Department's goals for grid
24 modernization are far-reaching and are clearly reflected in its filing requirements
25 for the present Grid Modernization Plans (GMPs).

1 However, we find that the Companies' GMPs are not consistent with the
2 Department's grid modernization goals and directives. The GMPs demonstrate a
3 range of understanding of, enthusiasm for, and commitment to the Department's
4 goals for grid modernization on the part of the three Companies. Despite this, all
5 three GMPs are too narrowly focused on technological improvements, and do not
6 account for the potential for distributed energy resources (DER) and customer
7 engagement to meet system needs and reduce electricity costs.

8 Consequently, the Companies' GMPs do not provide sufficient information to
9 justify the grid modernization investments proposed by the Companies.
10 Department approval of any such investments should be justified with
11 significantly more detailed business plans with thorough analysis of costs,
12 benefits, and other implications for customers.

13 **Q Please summarize your primary recommendations.**

14 **A**First and foremost, we recommend that the Department decline to approve utility
15 grid modernization investments based on the Companies' incomplete and
16 insufficient Grid Modernization Plans. Instead, we recommend that the
17 Department require the Companies to submit new GMPs before making any
18 findings on the cost recovery of the grid modernization investments. Given the
19 importance of grid modernization and the rapidity with which technologies
20 develop and change, these new plans should be filed no later than a year from the
21 Department's issuance of a final resolution in these proceedings.

22 In recognition of the Department's clear expectation that grid modernization will,
23 going forward, be a part of each Company's normal business practice, we
24 recommend that the scope of these new GMPs explicitly include all distribution
25 system needs rather than focusing only on those that can be separately parsed as
26 "grid modernization." These new GMPs should, therefore, serve as
27 comprehensive, forward-looking distribution system planning documents. The
28 GMPs should contemplate a twenty-year planning period, with a focus on the first

1 five years of the plan. Each revised plan should include several elements that are
2 necessary to fully respond to the Department's goals for grid modernization and
3 GMPs but nonetheless are lacking from the current filings. These elements
4 include:

- 5 • An investigation and description of the Company's distribution system
6 needs throughout the planning period, including both the need to satisfy
7 sales and peak demand at the system and substation levels, and the need
8 for modernization to enable use of a greater diversity of resources and,
9 ultimately, lower system costs;
- 10 • A clear and comprehensive description of the resources available to meet
11 distribution system needs and objectives throughout the planning period.
12 These resources should include all conventional distribution investments
13 as well as all potential DERs. Detailed forecasts of the costs, capabilities,
14 and availabilities of all resources should be key aspects of these
15 descriptions;
- 16 • A clear and comprehensive description of the resources that the Company
17 proposes to use to meet distribution system needs and objectives
18 throughout the planning period, with details regarding both conventional
19 distribution investments and DERs. These details should include the
20 expected capabilities or size of each resources—for example, expected
21 MWh of generation, MW of capacity, or MVAr of compensation;
- 22 • A clear and comprehensive business case analysis of the key resources
23 that the Company proposes to use to meet distribution needs throughout
24 the planning period. This should include all relevant costs, benefits, and
25 qualitative factors considered in the business case, as well as a detailed
26 narrative justification of proposed investments;

- 1 • Forecasts of key system outcomes and indicators, for example DER
2 penetration rates, annual distribution system revenue requirements, annual
3 system CO₂ emission rates, and measures of customer and third-party
4 activity and engagement;
- 5 • A customer engagement plan, indicating how the Company will educate
6 customers, provide them with access to DERs, and otherwise provide
7 them with the means to optimize their consumption patterns.
- 8 • A third-party engagement plan, indicating what steps the Company will
9 take to encourage third-parties (including DER developers and customer
10 aggregators) to provide technologies and services to customers and to the
11 Company; including draft requests for proposals to procure non-wires
12 alternatives (NWAs) to conventional distribution investments.

13 Without this type of information in the GMPs, the Department will not have
14 sufficient information to approve grid modernization investments before they are
15 made.

16 In addition, we recommend that the Department require each Company to collect
17 additional metrics reflective of these priorities. We recommend that all
18 performance metrics be published on a publicly-accessible web dashboard for the
19 benefit of stakeholders and the public. The Department should eventually
20 establish targets for these metrics, and a process for evaluating the Companies'
21 performance relative to those targets.

22 **3. GRID MODERNIZATION**

23 **Q What is “grid modernization” and why would the grid need to be**
24 **“modernized”?**

25 **A In recent years, major advances in technology have led to transformative change**
26 **in many different industries and infrastructure systems. With respect to the**

1 electricity industry in particular, advances in distributed energy resources as well
2 as sensor, control, and communication technologies have progressed to the point
3 where they can enable significant changes in the way the grid is operated and
4 interacted with—if accompanied by appropriate changes in business practice. The
5 implementation of these technologies and the accompanying changes in
6 operations are referred to as “grid modernization.”

7 **Q What sorts of changes fall under the definition of “grid modernization”?**

8 **A** Generally speaking, “grid modernization” can be narrowly defined or broadly
9 defined. Narrow definitions of grid modernization tend to focus on the
10 incorporation of technological improvements only, while broad definitions entail
11 a conceptual reimagining of the electric grid itself and of the roles of the electric
12 utility, electricity customer, and third-party providers of grid- or grid-adjacent
13 services. In the broad definition of grid modernization, technological change is
14 accompanied by increased customer engagement and a focus on integration of
15 distributed energy resources. These, in turn, enable the achievement of
16 overarching policy goals concerning the electricity system, and can reduce system
17 costs by allowing increasing reliance on distributed resources to satisfy demand
18 and optimize load shapes..

19 **Q What improvements are enabled by grid modernization, as narrowly
20 defined?**

21 **A** Under the narrow definition of grid modernization, installation of new
22 technologies can facilitate improved provision of utility services. For example,
23 investments in distribution system sensors and controls may improve reliability
24 and enable the utility to integrate more distributed generation. Under this narrow
25 definition, utility services are enhanced, but the fundamental role of the utility
26 remains unchanged.

1 **Q What improvements are enabled by the broad conception of grid**
2 **modernization?**

3 **A** Broader approaches to grid modernization tend to focus on technologies,
4 practices, and actions that will transform the role of the electric utility. In today's
5 grid, electricity is transmitted from centralized generators to passive customers
6 who have minimal ability to access information concerning their usage or to alter
7 their consumption patterns. In a modern grid, a diverse range of resources and
8 resource types can interact with the grid, and interactions (such as purchases and
9 sales of energy or ancillary services) may occur anywhere in the grid structure.
10 The range of interactions between utilities, customers, and third parties is larger
11 and more flexible than in today's grid. Customers may both manage their electric
12 bills and contribute to high-quality electrical service by consuming, generating,
13 storing, and conditioning power using distributed resources. The increased
14 diversity of resources on the grid and enhanced abilities of customers to optimize
15 their consumption patterns can lead to reductions in peak loads, improvements in
16 power quality, and, ultimately, lower system costs.

17 As we mentioned, these changes are enabled not just by technology, but also by
18 accompanying changes in business practices and customer behavior. Technology
19 allows the modern grid to be information-rich but is not sufficient by itself to
20 empower customers to become active decision-makers and co-participants on the
21 grid. For that to occur, customers must have both the ability to act on the
22 information that is available and the tools necessary to do so.

23 In the most complete vision of a modern grid, therefore, utilities facilitate third
24 party and customer use of such tools, and to optimize customer consumption
25 patterns utilizing both distributed resources and utility-owned investments. All
26 parties interacting with the modern grid are envisioned to have access to both data
27 and insights built on that data, as well as the ability to act—and ability to benefit
28 from acting—on those insights.

1 **Q What is necessary to achieve this broad vision of a modern grid?**

2 **A** There are several components that together can contribute to achievement of a
3 modern grid. Technology is one—but, importantly, not all technologies are
4 appropriate for every jurisdiction or application. Furthermore, technology is not,
5 in and of itself, an end of grid modernization. Rather, grid modernization
6 technologies can enable far-reaching changes in the capabilities and behavior of
7 grid participants in ways that may provide significant benefits to grid users. Like
8 any other grid investment, technology investments directed at modernization must
9 provide benefits that outweigh their costs. Unlike other investments, however, the
10 cost-effectiveness of grid modernization technologies often depends on these
11 behavior changes on the part of both customers and the utility.

12 As such, changes in policy, utility incentives, and price signals to customers are
13 all necessary to achieve transformative grid modernization. Regulators should
14 ensure that utilities are fully exploiting cost-effective investments in new
15 technologies (both behind and in front of the meter) to provide high-quality
16 service at low cost. Utilities must consider modern grid technologies and
17 strategies as some of the primary tools for meeting system needs, meaning that
18 grid modernization must be integrated with utilities' overall distribution system
19 planning processes.

20 Regulators must also prompt utilities to empower customers to better optimize
21 their consumption patterns and manage their bills. In order to allow this, utilities
22 must provide information, rate options, and appropriate grid access to both
23 customers themselves and to third-party service providers. While capital
24 investments may enable these interactions between utility, customer, and third-
25 party, utilities must also cooperate in fostering customer engagement and creating
26 new markets for provision of modern grid services.

1 **Q Please expand on the role of capital investments in a broad vision of grid**
2 **modernization.**

3 **A** In general, utilities make capital investments to meet system needs. Grid
4 modernization investments are no exception—ultimately, all capital investments
5 must be directed at providing high-quality service at low cost. The particular role
6 of the sorts of new or incremental capital investments at issue in a broad vision of
7 grid modernization is to enable customers, service providers, and utilities to
8 collect data, glean insights from those data, and exert new forms of control over
9 the flow of real and reactive power on the system as informed by those data and
10 insights. Importantly, simply collecting data or enabling control is insufficient in a
11 broad view of grid modernization; insights into system and customer needs are
12 key to guiding all parties’ interactions with the modernized grid. Data collected
13 through capital improvements can allow determination of where system upgrades
14 are needed to enable integration of greater amounts of DER—or, conversely, of
15 where integration of DER may allow deferral of traditional system upgrades. Data
16 may reveal business opportunities for third-party service providers. Most crucially
17 for a broad vision of grid modernization, data and controls are essential to
18 promoting active customer participation (through use of DER or other means) in a
19 modernized grid.

20 **Q Do capital investments into advanced metering functionality, distribution**
21 **system automation, and similar modernization initiatives provide these**
22 **benefits by default?**

23 **A** No. Like any other capital investment, grid modernization investments may be
24 undertaken effectively or wastefully. Rigorous and comprehensive planning
25 studies are necessary to fully justify such investments. These studies should
26 include an evaluation of system needs, an assessment of the resources available to
27 meet those needs, a determination of a resource plan that appropriately balances

1 cost with other priorities, and a clear forecast of key system outcomes in the
2 presence and absence this resource plan.

3 Initial efforts at grid modernization, often funded through the Department of
4 Energy, have conclusively demonstrated that investments in technology are
5 insufficient to provide transformative change if unaccompanied by customer
6 engagement and use of appropriate incentives for all parties.¹ As stated by DOE,
7 “success hing[es] on the ability of...utilities to effectively engage customers.”²
8 Further, broad grid modernization was found to necessitate “new utility business
9 models, system architectures, and planning requirements.”³ These comments
10 reflect the clear conclusion that installation of new technologies is not, in and of
11 itself, sufficient to accomplish a modern grid. Indeed, we observe that sound and
12 thorough planning is perhaps most important in situations where capital
13 investments must be matched with other efforts to effect transformative change,
14 as in broad grid modernization. Thorough planning is crucial in such situations
15 exactly due to the uncertainty and complexity associated with making such
16 changes.

17 **Q Please expand on the role of distribution system planning in a broad vision of**
18 **grid modernization.**

19 **A** Utilities routinely make investments to maintain or augment the distribution
20 system as necessary to satisfy demand by customers. These needs are dictated by
21 actual customer consumption patterns on the level of the system as a whole as
22 well as individual substations. In a modern grid, many of these investments can be
23 avoided or deferred using “non-wires alternatives” (NWAs). For example,
24 customer adoption of energy storage can reduce substation peak loads. As such,

¹ U.S. Department of Energy, “Final Report on Customer Acceptance, Retention, and response to Time-Based Rates from the Consumer Behavior Studies,” pp. 68-69 (Nov. 2016), https://www.smartgrid.gov/files/CBS_Final_Program_Impact_Report_20161107.pdf.

² *Id.*, p. 70.

³ U.S. Department of Energy, “Smart Grid Investment Grant Program Final Report,” p. 14 (Dec. 2016), https://energy.gov/sites/prod/files/2017/01/f34/Final%20SGIG%20Report%20-%202016-12-20_clean.pdf.

1 grid modernization has an impact on both distribution system needs and the range
2 of resources available to meet those needs. A holistic view of distribution system
3 planning is therefore necessary for modernized grids (or those undergoing
4 modernization) to ensure that the lowest cost or most beneficial resource is used
5 to meet system needs.

6 **Q Has the need for thorough planning and justification of grid modernization**
7 **investments been recognized by utility regulators?**

8 **A** Yes. Utility regulators in New York,⁴ California,⁵ and Hawaii⁶ have all set forth
9 clear and comprehensive requirements for distribution-system planning processes
10 aimed at accomplishing broad and transformative grid modernization. For
11 example, the New York Reforming the Energy Vision (REV) process requires all
12 utilities to submit both initial and supplemental plans for transforming their
13 distribution systems as a whole into “platforms” for engagement and innovation.⁷
14 These plans explicitly meant to be both comprehensive and transparent.⁸
15 Similarly, in California, utilities are required to submit whole-system
16 “Distribution Resource Plans” for modernization of the grid, animating
17 opportunities for DER, and enabling customer choice.⁹ The Massachusetts
18 Department of Public Utilities’ own orders on this subject also reflect such a
19 recognition, as we discuss below.

⁴ NY DPS Staff, “Staff Proposal Distributed System Implementation Plan Guidance,” Case 14-M-0101, *Proceeding on Motion of the Commission in Regard to Reforming the Energy Vision* (Oct. 15, 2015).

⁵ California Public Utilities Commission, Rulemaking 14-08-013, “Order Instituting Rulemaking Regarding Policies, Procedures and Rules for Development of Distribution Resources Plans Pursuant to Public Utilities Code Section 769” (Aug. 14, 2014).

⁶ Hawaii Public Utilities Commission, “Order No. 34281, Dismissing Application Without Prejudice and Providing Guidance for Developing a Grid Modernization Strategy” (Jan. 4, 2017).

⁷ NY DPS Staff, p. 1.

⁸ *Id.*, p. 4.

⁹ California Public Utilities Commission, “Assigned Commissioner’s Ruling on Guidance for Public Utilities Code Section 769 - Distribution Resource Planning,” Rulemaking 14-08-013, *Order Instituting Rulemaking Regarding Policies, Procedures and Rules for Development of Distribution Resources Plans Pursuant to Public Utilities Code Section 769*, p. 3 (Feb. 6, 2015).

1 In all of these jurisdictions, regulators have recognized the potential of grid
2 modernization to reduce distribution system costs, contribute to the achievement
3 of overarching policy goals, enable integration of distributed resources, and open
4 new avenues for customer engagement and empowerment—as well as the need to
5 pursue grid modernization based on careful and comprehensive planning.

6 **Q How can grid modernization reduce distribution system costs?**

7 **A** As above, grid modernization can allow for deferral of, avoidance of, or lower-
8 cost alternatives to traditional distribution system investments. Broad grid
9 modernization takes advantage of new technologies and innovative uses for those
10 technologies to improve power quality, fully utilize existing assets, and enable
11 more rapid detection of and response to outages. DER integration, in particular,
12 can promote a more resilient and efficient distribution system. Increases in
13 customer engagement can allow customers more control over their consumption
14 patterns, leading to improvements in load factor. Third-party service providers, in
15 particular, are often well-equipped to contribute to these benefits given their
16 greater agility than utilities and ability to leverage new and innovative core
17 competencies and business models.

18 **Q How can grid modernization contribute to the achievement of policy goals?**

19 **A** The broad and transformative vision of grid modernization can enable
20 achievement of a wide variety of energy policy goals. For example, the Hawaii
21 PUC has stated that the modernized grid is “the ‘backbone’ necessary to advance
22 the State’s RPS goals, support integration of additional levels of renewables,
23 encourage competition, empower consumers to make their own choices
24 concerning the level and types of electric service they desire, and leverage
25 customer-sited resources to assist in grid operation.”¹⁰

¹⁰ Hawaii Public Utilities Commission, "Order Dismissing Application Without Prejudice and Providing Guidance for Developing a Grid Modernization Strategy," Docket No. 2016-0087, *In the Matter of the*

1 **Q How can grid modernization enable greater use of DERs?**

2 **A** Under a broad approach to grid modernization the focus is not only on the safe
3 and reliable operation of the grid under growing quantities of DERs, but also on
4 how DER resources can best serve as a resource for the grid. For example, New
5 York envisions that “distributed energy resources . . . will be integrated into the
6 planning and operation of electric distribution systems, to achieve optimal system
7 efficiencies, secure universal, affordable service, and enable the development of a
8 resilient, climate-friendly energy system.”¹¹

9 The role of the utility is then expanded to include the facilitation of additional
10 DER development in areas where such resources can provide the most value to
11 the grid. This might take the form of leveraging DER investments to avoid or
12 defer traditional infrastructure investments, better forecast DER growth, and
13 direct DER development to areas where such growth may be most beneficial to
14 the grid.

15 **Q How can grid modernization empower customers?**

16 **A** Customer empowerment is a central component of broad approaches to grid
17 modernization. A common example of customer empowerment is implementation
18 of rate designs that enable customers to have greater control over their bills
19 through shifting the timing of their electricity consumption. Such rate designs
20 may also be accompanied by significant efforts on behalf of the utility to help
21 customers choose the rate designs that are most appropriate and provide the
22 customers with in-home technologies to help customers respond to price signals.

23 Customer empowerment may also mean providing customers with more
24 accessible and timely information regarding their usage (e.g., through web portals

Application of HECO, HELCO, and MECO for Approval to Commit Funds for the Smart Grid Foundation Project, p. 2 (Jan. 4, 2017).

¹¹ New York Public Service Commission, “Order Adopting Regulatory Policy Framework and Implementation Plan,” Case 14-M-0101, *Proceeding on Motion of the Commission in Regard to Reforming the Energy Vision* (Feb. 26, 2015).

1 or mobile applications) or even enabling customers to provide ancillary services
2 to the utility system. For example, emerging vehicle-to-grid (V2G) technology
3 provides compensation to electric vehicle owners for enabling the utility to use a
4 small portion of their vehicle batteries for providing balancing services to the
5 grid.¹²

6 Broad forms of grid modernization also seek to facilitate the ability of DER
7 providers to connect with customers through greater sharing of customer data
8 (with appropriate customer privacy protections).

9 To summarize, a broader approach to grid modernization seeks to fully exploit the
10 opportunities provided by new technologies to engage customers and DER
11 providers and to reduce distribution system costs and realize a wide variety of
12 energy policy goals. While incremental capital investments in new technologies
13 may contribute to and enable this approach, they are by no means sufficient to
14 achieve it.

15 **4. THE MASSACHUSETTS DPU'S VISION FOR GRID MODERNIZATION**

16 **Q How did the Department of Public Utilities articulate its vision for grid
17 modernization in Massachusetts?**

18 **A** The Department described its vision and goals for grid modernization in a Notice
19 of Investigation (NOI) and three resulting Orders. The first Order (12-76-A)
20 describes the Department's goals and objectives for grid modernization in a broad
21 sense and outlines a straw proposal for the structure of the Grid Modernization
22 Plans (GMP) ultimately filed by the Companies in these dockets. The straw

¹² See, e.g., Doug Peeples, "Vehicle-to-Grid Technology: It Could Be a Smart Idea for Smart Cities," SmartCitiesCouncil, (Sept. 2, 2016), <https://www.enel.it/en/media/press/d201608-nissan-enel-and-nuvve-operate-worlds-first-fully-commercial-vehicle-to-grid-hub-in-denmark.html>; U.S. Air Force, "AF Partners with Army, Industry to Successfully Develop, Test Vehicle-to-Grid Technology," (Oct. 22, 2015), <http://www.af.mil/News/ArticleDisplay/tabid/223/Article/625606/af-partners-with-army-industry-to-successfully-develop-test-vehicle-to-grid-tec.aspx>.

1 proposal was refined in the Department’s second Order (12-76-B), which defined
2 the necessary components of the Companies’ GMPs. The DPU set forth a
3 structure for the GMPs that includes a description and business case justification
4 of a short-term investment plan (STIP) directed at achieving advanced metering
5 functionality (AMF) and other grid modernization improvements, as well as a
6 comprehensive plan for customer marketing, education, and outreach (MEO).
7 Finally, the Department detailed its requirements further and directed the
8 Companies to prepare and file GMPs in its last Order (12-76-C).

9 **Q Did the Massachusetts Department of Public Utilities indicate that it sought a**
10 **broad approach to grid modernization or a narrow approach?**

11 **A** Unquestionably, the Department indicated interest in a broad approach. The
12 Department’s vision for grid modernization is the focus of its first Order on the
13 matter. The Department’s identification of the capabilities of a modern grid in this
14 Order was expansive and based in a vision of empowered consumers interacting
15 with an increased diversity of resources on the grid, in accordance with the
16 Commonwealth’s “statutory directives and policy goals.”¹³ Under the
17 Department’s framework a modern grid “empower[s] customers to adopt new
18 electricity technologies and better manage their use of electricity.”¹⁴ The
19 Department further described a modern grid as one that “can support further
20 development of energy efficiency, demand response, distributed generation,
21 storage, electric vehicles (‘EVs’), renewable energy resources, and *innovations*
22 *that we have yet to imagine.*”¹⁵

23 **Q What are the Department’s goals for grid modernization?**

24 **A** The Department set out four distinct objectives for grid modernization:

25 1. Reducing the effects of outages;

¹³ 12-76-A, p. 1.

¹⁴ *Id.*

¹⁵ *Id.*, pp. 1-2 (emphasis added).

- 1 2. Optimizing demand, including reducing system and customer costs;
- 2 3. Integrating distributed resources; and
- 3 4. Improving workforce and asset management.¹⁶

4 **Q Did the Department intend for the accomplishment of these goals to entail**
5 **transformative change?**

6 **A** Yes. The Department indicated clearly that, while business as usual approaches
7 may be valuable, they do not constitute grid modernization *per se*. For example,
8 with respect to outages, the Department stated that “while we agree that outage
9 prevention is an important function for electric distribution companies, it does not
10 require advanced technologies or new practices.”¹⁷ Rather, the Department
11 described decentralization and automation efforts to “reduce the effects of
12 outages” as “transformative.”¹⁸ Similarly, the Department recognized the
13 importance of customer action in particular in optimizing demand and the
14 necessity of appropriate incentive structures to prompt that action.¹⁹

15 **Q Did the Department focus only on the technological aspect of grid**
16 **modernization?**

17 **A** No. The Department rightly describes new technology, such as advanced metering
18 infrastructure (AMI), as “a basic . . . platform for grid modernization” rather than
19 constituting modernization in and of itself.²⁰ The Department also recognizes that
20 “it is appropriate for the Department to identify goals and objectives, but not
21 specific technologies,” making clear that technology is not the end goal of grid
22 modernization but a means to accomplish the goals and objectives thereof.²¹

¹⁶ 12-76-B, p. 2.

¹⁷ 12-76-A, p. 11.

¹⁸ *Id.*

¹⁹ *Id.*, p. 14.

²⁰ *Id.*, p. 12

²¹ *Id.*, p. 10.

1 **Q Did the Department recognize the importance of customer engagement to the**
2 **realization of a modern grid?**

3 **A** Yes. The Department recognized that “successful implementation of grid
4 modernization will require fundamental changes in the relationship between the
5 companies and their customers,”²² specifically stating that “customer participation
6 is necessary to realize many of the benefits of grid modernization.”²³

7 **Q Did the Department discuss the necessity of changes to utility practices and**
8 **incentives?**

9 **A** Yes. The Department clearly envisioned grid modernization becoming a central
10 part of utility operations, and noted that “initially, it will involve some changes to
11 [utilities’] traditional planning and practices.”²⁴ The Department identified the
12 GMPs as an integral part of this shift in the Companies’ planning processes, as we
13 discuss below. The Department also recognized the need to “align an electric
14 distribution company’s investment priorities with the interests and needs of its
15 customers.”²⁵

16 **Q Did the Department reiterate its broad and transformative vision in its**
17 **subsequent Orders?**

18 **A** Yes. The Department’s second and third Orders refine the filing requirements for
19 the Companies’ GMPs and do not reduce the scope or vision of the Department’s
20 grid modernization goals. Indeed, the Department describes its subsequent Orders
21 as establishing “the platform and the incentives for utilities and other businesses
22 to innovate.”²⁶

²² *Id.*, p. 19.

²³ *Id.*

²⁴ 12-76-A, p. 9.

²⁵ *Id.*, p. 27.

²⁶ 12-76-B, p. 1.

1 **Q How is the Department’s vision reflected in the GMP filing requirements?**

2 **A** The Department made clear in several ways that it crafted its filing requirements
3 for the Companies’ GMPs specifically to reflect the vision it originally set forth.
4 First and foremost, the Department specifically identified the GMPs as the main
5 component of “a comprehensive approach to addressing the various, interrelated
6 aspects of modernizing the electric grid”²⁷ and noted that the plans should
7 describe both “investment *and operational* strategies for achieving grid
8 modernization.”²⁸ These statements make the broad intent of the GMPs clear.

9 Moreover, while the GMPs require the Companies to propose a plan and a
10 business case for installation of modern grid technologies (including but not
11 limited to those that provide advanced metering functionality), the Department
12 included special provisions that would not normally be part of utility investment
13 plans. For example, with regards to the business case for such investments, the
14 Department *obligated* the Companies to include “all difficult to quantify or
15 unquantifiable benefits and costs”²⁹ in its business case analysis.

16 **Q Did the Department emphasize DER integration in its filing requirements?**

17 **A** Yes. In addition to including DER integration as one of the primary objectives for
18 grid modernization, the Department set out specific metrics for measuring the
19 Companies’ progress in achieving this objective.³⁰

20 **Q Did the Department recognize the importance of customer engagement in its
21 filing requirements?**

22 **A** Yes. The Department included a customer MEO plan as one of the four key
23 components of the GMP, explicitly stating that “customer education, marketing,

²⁷ 12-76-A, p. 9.

²⁸ *Id.*

²⁹ 12-76-B, p. 17.

³⁰ *Id.*, p. 32.

1 and outreach are crucial to enabling the successful implementation of grid
2 modernization.”³¹

3 **Q Did the Department refer to the Commonwealth’s policy goals in its filing**
4 **requirements?**

5 **A** Yes. The Department required the Companies to devote a section of the business
6 case analysis to a demonstration of how their proposed investment plants “will
7 impact . . . state policy goals.”³² The Department also specifically instructed the
8 Companies to assess the extent to which their plans would provide “benefits of
9 avoided [Global Warming Solutions Act] compliance costs.”³³

10 **Q Did the Department note potential changes to utility incentive structures in**
11 **its filing requirements?**

12 **A** Yes. For example, the Department required the Companies to collect and report
13 on a variety of metrics related to grid modernization. While the current purpose of
14 those metrics is “to record and report information”, the Department recognized
15 that they may inform “incentives or penalties” in the future.³⁴

16 The Department’s decision to allow a targeted cost recovery mechanism for
17 certain grid modernization investments was also explicitly described as a means
18 to address the concern that the Companies would not pursue such investments
19 because “the benefits will accrue in large part to customers and not to the electric
20 distribution company[ies].”³⁵ The Department recognized that, although “grid
21 modernization...is a core component of an electric distribution company’s
22 obligation to provide safe and reliable service,”³⁶ the initial investments required

³¹ 12-76-B, p. 2.

³² 12-76-C, p. 8.

³³ *Id.*, p. 16.

³⁴ 12-76-B, p. 34

³⁵ *Id.*, Appendix 1, p. 12.

³⁶ 12-76-C, p. 26.

1 to effect transformative change may go “beyond what [the Companies] deem
2 necessary”³⁷ for this purpose. As such, the Department allowed a targeted cost
3 recovery mechanism to be used “*only* until such time as the costs are incorporated
4 into companies’ base distribution rates.”³⁸

5 These components of the Department’s filing requirements indicate that the
6 Department recognizes the need to align utility incentives with the goals and
7 objectives of grid modernization, and that the mechanisms employed for this
8 purpose may change over time as grid modernization becomes a normal—and
9 integral—part of the Companies’ business practices.

10 **Q Do the filing requirements overall require a broad and transformative**
11 **approach?**

12 **A** Yes. The Department’s GMP filing requirements indicate that it envisions a broad
13 approach to grid modernization, one that would significantly increase the role of
14 distributed energy resources and change how customers interact with the grid. The
15 required structure and components of the GMP were designed as the first step in
16 accomplishing this transformation.

17 **5. NATIONAL GRID’S GMP**

18 **Q Please summarize the goals and approach of National Grid’s GMP.**

19 **A** According to National Grid, the Company formulated its GMP to “move
20 operation of the distribution grid towards greater levels of efficiency and
21 reliability, while enabling a cleaner and more environmentally-friendly electric
22 system.”³⁹ The Company presents four different investment scenarios, each
23 presumably designed to allow it to meet this goal. However, the Company hedges
24 its language when it comes to its GMP and the investment plans contained

³⁷ *Id.*, p. 25.

³⁸ *Id.*, p. 26 (emphasis added).

³⁹ National Grid GMP, p. 7.

1 therein. Rather than committing to a transformative vision, of which the GMP
2 would be a crucial first step, the Company describes its GMP as simply
3 “begin[ning] a discussion.”⁴⁰ As we discuss below, while National Grid has
4 demonstrated enthusiasm for modernization, its tentative approach informs the
5 entire structure of the Company’s GMP.

6 **Q Is National Grid’s GMP a roadmap to grid modernization? Does it serve as a**
7 **comprehensive planning document, suitable to guide a broad and**
8 **transformative modernization of the grid?**

9 **A**No. As discussed below, the Company’s GMP lacks a comprehensive description
10 of distribution system needs and the resources available to meet those needs, an
11 evaluation of those resources, or a well-justified proposal of a resource plan that
12 appropriately balances cost with other system considerations. Instead, the
13 Company has presented a plan to receive pre-approval for millions of dollars of
14 spending on distribution system upgrades, without a sound justification based on a
15 detailed discussion of costs, outcomes, and alternatives.

16 While the Company was able to detail four separate capital spending plans, its
17 GMP fails to comply with the vision set forth by the DPU. As we describe below,
18 the Company’s GMP does not devote appropriate attention and effort to the
19 DPU’s goal of furthering DER integration, provides an insufficient plan to engage
20 customers (and third-parties interested in providing enabling services to those
21 customers), and proposes to rely on a set of metrics that would not allow the DPU
22 and stakeholders adequate visibility of the Company’s progress towards achieving
23 a broad transformation. Ultimately, we find that the Company’s GMP is not the
24 comprehensive planning document required by the Department, and does not
25 provide the Department with evidence sufficient to justify significant spending on
26 grid modernization investments.

⁴⁰ *Id.*

1 **Q Does National Grid’s GMP propose significant grid modernization**
2 **investments?**

3 **A** Yes. The Company proposes four separate scenarios.⁴¹ These include:

- 4 1. Balanced – maximum deployment of both AMI and distribution system
5 upgrades, with training and improved mobility tools for workforce
6 management.
- 7 2. AMI-focused – an opt-out AMI deployment plan, with distribution system
8 upgrades as necessary and limited workforce training.
- 9 3. Grid-focused – the inverse of the AMI scenario, this plan focuses only on
10 distribution system upgrades and relies primarily on an opt-in system for AMI
- 11 4. Opt-in – the most modest of the plans, this scenario envisions opt-in
12 participation only in AMI and limited distribution system upgrades.

13 All four scenarios include significant capital investments: the costs of the four
14 scenarios range from \$235.4 to \$980.6 million, with the Balanced plan having the
15 highest costs and the Opt-in plan having the lowest.⁴²

16 **Q Does National Grid’s GMP discuss the Company’s distribution system**
17 **investment needs?**

18 **A** National Grid presents a cost summary of its baseline capital plan⁴³ in order to
19 define its grid modernization investments as fully incremental to its business-as-
20 usual investments. This baseline capital plan is based on system repair or upgrade
21 needs. As the Company makes clear in its description, its proposed grid
22 modernization investments are not *necessary* to enable the Company to “meet its
23 obligation to provide safe and reliable service, and to meet its service quality

⁴¹ *Id.*, p. 9.

⁴² *Id.*, p. 13.

⁴³ *Id.*, p. 24.

1 goals.”⁴⁴ However, the extent to which the Company’s STIP is *able* contribute to
2 satisfying these needs in the present and over the future is left undetermined.

3 Indeed, National Grid states only that “it is possible” that its proposed
4 investments could take the place of conventional capital investments in
5 responding to system needs.⁴⁵ National Grid explicitly intends to defer
6 investigation of this topic, stating that “while the Company expects to observe and
7 study” these effects, “for now [they are] unquantified.”⁴⁶ As such, in addition to
8 being *incremental* to the Company’s baseline capital plan, the STIP is also
9 positioned as being *independent* of it: these investments are not targeted towards
10 or justified on the basis of their ability to meet the needs of the system now or in
11 the future.

12 **Q How did National Grid select and justify the proposed investments, if it did**
13 **not do so based on system needs?**

14 **A** National Grid’s description of how it selected its investments is very limited,
15 consisting almost entirely of one paragraph identifying the various internal
16 working groups convened to “evaluate the elements that the Company could
17 include in its GMP.”⁴⁷ As such, although input from stakeholders was considered
18 by the working groups, stakeholders themselves have little insight into the
19 formation of plans. For example, the GMP does not describe the potential
20 investments that were considered and rejected by the Company or how the
21 Company determined the appropriate investment level for different technologies.

22 The Company’s STIP is justified primarily on the basis of its business case cost-
23 benefit analysis. However, of these four scenarios, the Company finds only the
24 AMI-focused scenario to provide net benefits to customers over a 15-year

⁴⁴ *Id.*, p. 27.

⁴⁵ *Id.*, p. 48.

⁴⁶ National Grid GMP, p. 115.

⁴⁷ *Id.*, p. 175.

1 period.⁴⁸ The Company refrains from recommending that the Department approve
2 any of the scenarios in particular, instead positioning its GMP as an opportunity
3 “for the Department and other interested stakeholders to engage in a robust
4 discussion about the range of options and benefits”⁴⁹ of these scenarios.

5 **Q Has the Company provided sufficient information regarding the outcomes of**
6 **its scenarios to foster such a discussion?**

7 **A** No. While we commend National Grid on its commitment to grid modernization
8 and to stakeholder involvement in its grid modernization planning processes, the
9 Company’s discussion of the outcomes and benefits of its various scenarios does
10 not provide a clear or comprehensive picture of the anticipated impacts on the
11 Department’s grid modernization objectives from each scenario. Cost-benefit
12 ratios are important, but the Company acknowledges that they are not sufficient to
13 capture the entire picture in this case—describing the “AMI-focused” scenario as
14 prioritizing near-term cost savings at the expense of “longer-term qualitative
15 benefits” that include “facilitating promotion of renewable and other types of
16 DG” and “creating the best platform for enabling the distribution system and
17 customers to take advantage” of grid modernization.⁵⁰ However, the Company has
18 not provided any forecast or estimation of the differences in these outcomes
19 between scenarios. Without such forecasts, it is impossible for stakeholders or the
20 Department to evaluate the Company’s claims in this matter.

21 **Q Should the Department expect the Company to include a concrete discussion**
22 **of outcomes in its GMP?**

23 **A** Yes. The Department clearly indicated that it wanted the Companies to discuss
24 the expected outcomes of their GMPs in a clear and concrete manner. The

⁴⁸ *Id.* p. 11.

⁴⁹ Exhibit PTZ-1, p. 5, line 13.

⁵⁰ National Grid GMP, pp. 123-124.

1 Department repeatedly instructs the Companies to outline how they “propose to
2 make *measurable* progress” towards the achievement of the Department’s
3 objectives for grid modernization.⁵¹ While the Companies’ actual progress
4 towards these objectives during and after implementation of its grid
5 modernization plan should be visible to the Department and stakeholders through
6 the use of metrics, as discussed below, the inclusion of metrics does not excuse
7 the Company from demonstrating an expectation of such progress in the plan
8 itself.

9 **Q Does National Grid’s GMP comprehensively address how the proposed**
10 **investments will enable achievement of the DPU’s goals for grid**
11 **modernization?**

12 **A** No. As described above, the Company provides estimations of several different
13 types of benefits but no quantitative basis for those estimations within the body of
14 the GMP. This deficiency is particularly pronounced with respect to the
15 Department’s goal of integrating DERs, which stands in contrast to the
16 Company’s decision to devote a separate section of its GMP specifically to the
17 question of distributed generation.

18 **Q What are the particular deficiencies of the plan with respect to integration of**
19 **DER?**

20 **A** There are two main deficiencies with respect to the Company’s treatment of DER
21 integration. First, the Company failed to consider and promote DER integration—
22 as both a means to grid modernization, and as an end thereof, and as a key
23 strategy for reducing distribution system costs and customer bills. Second, the
24 Company failed to demonstrate that its GMP would lead to increased DER
25 integration, which is one of the Department’s primary goals for grid
26 modernization.

⁵¹ 12-76-B, p. 2.

1 **Q You stated that the Company did not appropriately consider DER as a**
2 **resource for reducing distribution system costs and customer bills. Please**
3 **explain.**

4 **A** DER and other “non-wires alternatives” are not among the technologies
5 considered by the Company to meet future distribution system needs. We note
6 here that the Department explicitly did not limit the scope of GMPs to capital
7 investments. Rather, the DPU clearly described the scope of GMPs to include “*all*
8 grid modernization planning and investments,” including but not limited to the
9 STIP.⁵² Distributed generation, energy efficiency, demand response, storage, and
10 electric vehicles all fall within this scope and would be expected to impact the
11 Company’s distribution system needs and costs. . A sound GMP should include a
12 thorough economic analysis of the extent to which each of these resource types
13 could help improve distribution system efficiency and reduce distribution system
14 costs.

15 **Q Did the Company show that its planned investments will further the**
16 **Department’s goal of integrating of distributed resources?**

17 **A** No. The Company’s GMP includes no quantitative evaluation of DER adoption
18 with and without implementation of the plan. Such a forecast is absent even in a
19 special chapter devoted entirely to distributed generation—although that section
20 proposes additional investments specifically intended to increase penetration of
21 distributed generation. Nor did the Company provide a forecast of other
22 distributed resources, such as storage and demand response. “Integrating DERs”
23 is listed as an “unquantifiable benefit”⁵³ that may or may not accrue as a result of
24 investments in data collection technologies. The Company claims that these

⁵² 12-76-B, p. 17; emphasis original.

⁵³ National Grid GMP, p. 115.

1 investments “should support...the integration of distributed resources and
2 storage” but does not attempt to forecast the impact of such support.⁵⁴

3 While the Department was clear that the Companies should consider
4 “unquantifiable” benefits,⁵⁵ we disagree with National Grid’s implication that
5 DER integration is among these. Utilities routinely forecast DER adoption rates
6 under different sets of assumptions. Indeed, when ISO New England convened a
7 Distributed Generation Forecast Working Group, representatives from National
8 Grid made up an eighth of the membership.⁵⁶ As such, we see no reason as to why
9 the Company could not perform such an analysis with regards to the impacts of its
10 GMP.

11 **Q How can the Department and stakeholders assess the Company’s progress**
12 **towards achievement of the goal of integrating DER?**

13 **A** The Department clearly intends for newly-required metrics to provide visibility
14 into the Company’s actual future success in integrating DER, regardless of
15 whether a forecast is presented in the GMP.

16 **Q Do the Company’s proposed metrics allow the Department and stakeholders**
17 **to perform such an assessment?**

18 **A** No. The Company proposes to use only the statewide metrics to measure its
19 progress on integrating DER. These metrics include the total number of grid-
20 connected DG facilities, as well as the nameplate capacity, estimated output, and
21 technology type of each resource. These metrics are a good start but do not
22 provide a comprehensive picture of the role of DER in National Grid’s system
23 over time. We recommend additional metrics that will allow the Department and
24 stakeholders to assess the role of DER in National Grid’s system, including:

⁵⁴ *Id.*

⁵⁵ 12-76-B, p. 17.

⁵⁶ See Attendance list of the December 8, 2015 meeting, https://www.iso-ne.com/static-assets/documents/2016/04/dgfwg_minutes_20151208.pdf.

- 1 1. The percentage of distribution system annual retail sales that is satisfied by
- 2 DER, by type of DER (energy efficiency, demand response, distributed
- 3 generation, storage technologies, and electric vehicles) and, ideally, by
- 4 substation;
- 5 2. The percentage of distribution system annual peak demand that is satisfied by
- 6 DER, by type of DER (energy efficiency, demand response, distributed
- 7 generation, storage technologies, and electric vehicles) and, ideally, by
- 8 substation;
- 9 3. The rate of DER adoption among customers of different rate classes.

10 **Q The DPU recognized that customer engagement is key to successful**
11 **modernization of the grid. Does National Grid’s GMP include a**
12 **comprehensive customer engagement plan, sufficient to enable customers to**
13 **act as empowered grid participants?**

14 **A No.** The Company’s Marketing, Engagement, and Outreach (MEO) plan focuses
15 primarily on customer education rather than on increasing opportunities for
16 customers to actively participate on the grid. For example, while the Company
17 includes data and analytics in its MEO, the purpose of these analytics is to allow
18 National Grid to target customers, rather than allowing customers to target their
19 own energy usage.⁵⁷ Similarly, the Company proposes to build online tools to
20 “facilitate [customer] consideration and adoption of DG”⁵⁸—but leaves out
21 provision of tools to allow customers to actively employ distributed generation
22 and other DER to control their load after installation.

⁵⁷ National Grid GMP, p. 162.

⁵⁸ *Id.*, p. 138.

1 **Q Does the Company’s customer engagement plan recognize the role of third**
2 **parties in empowering customer actions?**

3 **A** To some extent. The Company does identify third party vendors as an important
4 part of the ecosystem of a modern grid and describes plans to improve third
5 parties’ access to customer⁵⁹ and system⁶⁰ data. However, provision of data is not
6 sufficient to create a robust market of third-party vendors.

7 **Q Are the Company’s proposed metrics sufficient to enable the Department**
8 **and stakeholders to assess the Company’s progress in engaging customers?**

9 **A** No. The Company proposes only a report describing its MEO activities and “high
10 level results” of these activities.⁶¹ At the very least, the Company should report a
11 measure of the frequency with which customers access (or third parties access on
12 customers’ behalf) grid modernization touch points, such as its proposed
13 enterprise analytics platform.⁶²

14 **Q The Department identified achievement of the Commonwealth’s policy goals**
15 **as one of the most important outcomes of grid modernization. Does the**
16 **Company’s GMP clearly set forth the extent to which it will facilitate**
17 **achievement of these goals?**

18 **A** To a limited extent. Although the Department referred to nine different relevant
19 policies,⁶³ the Company quantified the outcomes of its GMP for only two: the
20 Department’s service quality standards and the Commonwealth’s Global
21 Warming Solutions Act (GWSA).

⁵⁹ *Id.*, p. 57.

⁶⁰ *Id.*, p. 67.

⁶¹ *Id.*, p. 174.

⁶² Such measures could include metrics common in the technology industry such as monthly active users and bounce rate (a measure of the extent to which visitors engage with a website such as the Company’s proposed “education and engagement” website).

⁶³ 12-76-C, p. 7.

1 With regards to GWSA compliance, National Grid claims that its proposed GMP
2 will result in avoidance of 950,000 tons of greenhouse gas emissions over the 15-
3 year GMP planning horizon.⁶⁴ The Company claims this benefit based on an
4 expectation of reduced energy consumption resulting from its STIP investments
5 and adoption of time-varying rates. However, the Company's publicly-available
6 GMP does not describe how it arrived at this value—for example, how much
7 energy National Grid actually expects these investments to avoid is unspecified,
8 as are any assumptions regarding the carbon intensity of the New England
9 electricity grid over the planning horizon. As such, we are unable to evaluate the
10 validity of this value.

11 The Company's expected emissions reductions equate to an average of only
12 63,300 tons of emissions per year—or less than one percent of the
13 Commonwealth's allowed emissions from electric generating units under either
14 the Regional Greenhouse Gas Initiative program⁶⁵ or the Department of
15 Environmental Protection's recently-proposed emissions rules.⁶⁶ Given the lack of
16 evidence supporting this value and its marginality with respect to the emissions
17 reductions required by the relevant policy goals, the Company has not
18 demonstrated that its GMP will substantively contribute to achievement of the
19 Commonwealth's policy goals.

20 **Q Has the Company demonstrated an ability to provide and implement a**
21 **comprehensive plan such as that you describe here?**

22 **A** Yes. National Grid is also a participant in the New York REV process, as
23 described above. In this process, the Company has submitted a more

⁶⁴ National Grid GMP, p. 113.

⁶⁵ Author's calculation based on 2017 CO₂ Allowance Base Budget for Massachusetts,
<http://www.rggi.org/docs/CO2AuctionsTrackingOffsets/Allocation/2017-Allowance-Allocation.xls>.

⁶⁶ Author's calculation based on 2020 emissions caps for new and existing units,
<http://www.mass.gov/eea/docs/dep/air/climate/gwsa-tsd-12-16-16.docx>.

1 comprehensive planning document⁶⁷ and begun to partner with third parties to
2 provide enhanced grid services and reduce system costs.⁶⁸ The Department should
3 expect the Company to demonstrate the same level of thoroughness and
4 commitment to transformative grid modernization in Massachusetts as it does in
5 New York or any other jurisdiction.

6 **Q Please summarize your evaluation of National Grid’s GMP.**

7 **A** In sum, National Grid’s GMP focuses too narrowly on the technologies available
8 to the Company to support grid modernization (e.g., field area network
9 communications systems, feeder monitors, or volt/VAR optimization), as opposed
10 to changes in practice that enable customers to take advantage of such
11 technologies. The Company’s GMP fails to comprehensively assess how its
12 proposed investments will promote DERs to satisfy system needs or contribute in
13 a concrete way to achievement of the Department’s goals for grid modernization.

14 While National Grid’s GMP shows a strong interest in grid modernization, it
15 cannot serve as a comprehensive planning document, suitable to act as a roadmap
16 for transformative change. The Company’s proposals for customer engagement
17 and DER integration are modest at best and make no attempt to open
18 opportunities for customers and DER to play more prominent and active roles on
19 the grid. Additionally, the Company’s proposed metrics provide relatively poor
20 visibility of its progress on empowering customers and integrating DER.

21 Ultimately, we find that the Company’s GMP is, as it stated, only the beginning
22 of the conversation. A more comprehensive plan is necessary to justify the level
23 of investment proposed in the plan and serve as a guide to transformative
24 modernization of the grid.

⁶⁷ National Grid DSIP, <http://nyssmartgrid.com/wp-content/uploads/National-Grid-DSIP.pdf>.

⁶⁸ Utilidata. “Utilidata and National Grid Announce Reforming the Energy Vision Project,” (Feb. 13, 2017), <https://utilidata.com/wp-content/uploads/2017/02/Utilidata-National-Grid-REV-release-FINAL-FINAL.pdf>.

1 **Q Given this evaluation, do you have recommendations to the Department**
2 **regarding the disposition of National Grid’s GMP?**

3 **A** Yes. First and foremost, we recommend that the Department decline to approve
4 spending based on the Company’s current GMP. Instead, we recommend that the
5 Department require a new GMP that corrects the deficiencies described above and
6 can serve as a comprehensive, forward-looking distribution system planning
7 document. This revised plan should include the following:

- 8 • An investigation and description of the Company’s distribution system
9 needs throughout the planning period, including both the need to satisfy
10 sales and peak demand at the system and substation levels, and the need
11 for modernization to enable use of a greater diversity of resources and,
12 ultimately, lower system costs;
- 13 • A clear and comprehensive description of the resources available to meet
14 distribution system needs and objectives throughout the planning period.
15 These resources should include all conventional distribution investments
16 as well as all potential DERs. Detailed forecasts of the costs, capabilities,
17 and availabilities of all resources should be key aspects of these
18 descriptions;
- 19 • A clear and comprehensive description of the resources that the Company
20 proposes to use to meet distribution system needs and objectives
21 throughout the planning period, with details regarding both conventional
22 distribution investments and DERs. These details should include the
23 expected capabilities or size of each resources—for example, expected
24 MWh of generation, MW of capacity, or MVAR of compensation;
- 25 • A clear and comprehensive business case analysis of the key resources
26 that the Company proposes to use to meet distribution needs throughout
27 the planning period. This should include all relevant costs, benefits, and

- 1 qualitative factors considered in the business case, as well as a detailed
2 narrative justification of proposed investments;
- 3 • Forecasts of key system outcomes and indicators, for example DER
4 penetration rates, annual distribution system revenue requirements, annual
5 system CO₂ emission rates, and measures of customer and third-party
6 activity and engagement;
 - 7 • A customer engagement plan, indicating how the Company will educate
8 customers, provide them with access to DERs, and otherwise provide
9 them with the means to optimize their consumption patterns.
 - 10 • A third-party engagement plan, indicating what steps the Company will
11 take to encourage third-parties (including DER developers and customer
12 aggregators) to provide technologies and services to customers and to the
13 Company; including draft requests for proposals to procure non-wires
14 alternatives (NWAs) to conventional distribution investments.

15 In addition, we recommend that the Department require the Company to collect
16 additional metrics, as enumerated above. We further recommend that the
17 Department require these metrics to be published on a publicly-accessible web
18 dashboard for the benefit of stakeholders and the public, and that the Department
19 establish targets for these metrics and a process for evaluating the Companies'
20 performance regarding these targets.

21 **Q Does this conclude your testimony regarding National Grid's GMP?**

22 **A** It does.

1 **6. UNITIL'S GMP**

2 **Q Please summarize the goals and approach of Unitil's GMP.**

3 **A** Unitil's GMP sets out a vision in which "grid operations will be more dynamic"
4 and the Company's role will shift "towards enabling . . . new and evolving
5 services to customers rather than directly providing them."⁶⁹ It seeks to
6 accomplish this vision through a mix of sixteen capital investment projects and
7 two other initiatives,⁷⁰ while balancing the need to meet the DPU's objectives,
8 maintain aging infrastructure, respond to customer interests, and accommodate
9 changes in the utility's role, business model, and regulatory obligations.⁷¹

10 Unitil is in a unique position in the Commonwealth because it has already
11 implemented AMI in most of its territory.⁷² The Company argues that it has
12 therefore already achieved the majority of the benefits available from Advanced
13 Metering Functionality (AMF). The Company claims on this basis that additional
14 AMF and enrollment in TVR should be offered on an opt-in, rather than opt-out,
15 basis,⁷³ despite the fact that its current level of AMI positions the Company to
16 better offer opt-out service. Instead of AMF, Unitil's STIP focuses on distribution
17 system control and stability upgrades and development of accompanying
18 analytical platforms and tools.⁷⁴

19 **Q Is Unitil's plan a roadmap to grid modernization? Does it serve as a**
20 **comprehensive planning document, suitable to guide a broad and**
21 **transformative modernization of the grid?**

22 **A** No. As discussed below, the Company's GMP lacks a comprehensive description
23 of distribution system needs and the resources available to meet those needs, an

⁶⁹ Unitil GMP, p. 10.

⁷⁰ *Id.*

⁷¹ *Id.*, p. 9.

⁷² *Id.*, p. 11.

⁷³ *Id.*

⁷⁴ *Id.*, p. 34.

1 evaluation of those resources, or a well-justified proposal of a resource plan that
2 appropriately balances cost with other system considerations. Instead, the
3 Company has presented a plan to receive pre-approval for millions of dollars of
4 spending on potentially unnecessary distribution system upgrades, with a
5 justification that depends more on rhetoric than on a detailed discussion of costs,
6 outcomes, and alternatives. The Company's GMP fails to mirror the vision set
7 forth by the DPU. As we describe below, the Company's GMP does not devote
8 appropriate attention and effort to the DPU's goal of furthering DER integration,
9 provides insufficient incentives to promote engagement of customers (and third-
10 parties interested in providing enabling services to those customers) in a
11 modernized grid, and proposes to rely on a set of metrics that would not allow the
12 DPU and stakeholders adequate visibility of the Company's progress towards
13 achieving a broad transformation. Ultimately, we find that the Company's GMP is
14 not the ambitious and comprehensive planning document requested by the
15 Department and does not provide the Department with evidence sufficient to
16 justify significant spending on grid modernization investments.

17 **Q Does Until's GMP propose significant investments?**

18 **A** Yes. The Company's STIP, as set forth in its GMP, comes at a cost of
19 approximately \$20.4 million over 15 years. Until's GMP fails to justify this level
20 of investment, either on the basis of demonstrable progress towards the
21 Department's grid modernization investment or on that of system needs.

22 **Q Does Until's GMP discuss the Company's distribution system investment**
23 **needs?**

24 **A** Yes. In fact, Until suggests that it essentially has no baseline investment needs
25 apart from system maintenance, claiming that "there is essentially no distribution
26 system benefits...gained from reducing peak demand" because its "service area

1 has seen a persistent decline in peak power over the past ten years.”⁷⁵ While this
2 statement may be true for Unitil’s service area as a whole, Unitil presented no
3 evidence that the same holds true for each and every substation or feeder in its
4 territory. As such, Unitil did not discuss whether and to what extent grid
5 modernization investments could contribute to satisfying system needs on this
6 more granular level.

7 **Q How did Unitil select and justify the proposed investments?**

8 **A** Unitil’s GMP is the result of an iterative screening process, in which a large
9 number of possible program components were whittled down based on various
10 criteria (for example, some options were deemed to be part of normal business
11 practice rather than grid modernization per se).⁷⁶ The Company argues that the
12 resulting plan is low-cost and low-risk and argues that it provides net benefits to
13 consumers.⁷⁷ While Unitil’s discussion of how it arrived at the set of investments
14 it proposes is clear, this discussion omits any description of how Unitil
15 determined the appropriate level of investment for each plan component. Without
16 such a description, it is impossible to connect the proposed investments and the
17 claimed outcomes.

18 **Q Did Unitil clearly describe the expected outcomes of its proposed investments**
19 **and GMP?**

20 **A** In general, no. With few exceptions, the Company’s descriptions of outcomes
21 from its proposed investments are vague. For example, the Company’s expected
22 outcome of the implementation of an advanced distribution management system
23 (ADMS) is a reduction in customer energy consumption by “2-3% or more.”⁷⁸ No
24 justification of this figure is presented by Unitil in its GMP. Similarly, in

⁷⁵ *Id.*, p. 19.

⁷⁶ *Id.*, p.109.

⁷⁷ *Id.*, p. 78.

⁷⁸ *Id.*, p. 52.

1 discussing its plan to engage customers with gamification, Unitil claims that such
2 a program may result in customers reducing energy consumption by “up to 5%,”
3 “based on industry reports for customers participating in this type of program.”⁷⁹
4 Notably, no such reports are cited. Other descriptions are simply speculative: per
5 Unitil, the Company “may also realize a lower peak” through AMF.⁸⁰ The
6 Company presents no forecast of whether such peak savings are actually expected
7 to occur and, if so, where and to what extent.

8 **Q Should the Department expect the Company to include a concrete discussion**
9 **of outcomes in its GMP?**

10 **A** Yes, certainly. The Department clearly indicated that it wanted the Companies to
11 discuss the expected outcomes of their GMPs in a clear and concrete manner. The
12 Department repeatedly instructed the Companies to outline how they “propose to
13 make *measurable* progress” towards the achievement of the Department’s
14 objectives for grid modernization.⁸¹ While the Companies’ actual progress
15 towards these objectives should be visible to the Department and stakeholders
16 through the use of metrics, as discussed below, the inclusion of metrics does not
17 excuse the Company from demonstrating an expectation of such progress.

18 **Q In particular, has the Company shown that its planned investments will**
19 **enable integration of DER?**

20 **A** No. Unitil’s proposed plan has several components directed at enabling DER,
21 including a circuit capacity study, analytics and an accompanying visualization
22 platform, and relay and voltage controls. Of the benefits of these projects, the
23 Company states, “[t]he benefits of DER Enablement ultimately depend on how
24 much DER is installed in the FGE service territory.”⁸² However, the Company

⁷⁹ *Id.*, p. 56.

⁸⁰ *Id.*, p. 59.

⁸¹ 12-76-B, p. 2.

⁸² Unitil GMP, p. 35.

1 makes no attempt to forecast DER installations in the presence and the absence of
2 its proposed investments, despite the fact that utilities routinely forecast DER
3 adoption rates under different sets of assumptions. As such, the Company failed to
4 demonstrate that its investments will allow it to make measurable progress
5 towards achievement of one of the Department's primary goals for grid
6 modernization.

7 **Q How can the Department and stakeholders assess the Company's progress**
8 **towards achievement of the goal of integrating DER?**

9 **A** The Department clearly intends for newly-required metrics to provide visibility
10 into the Company's actual future success in integrating DER, regardless of
11 whether a forecast is presented in the GMP.

12 **Q Do the Company's proposed metrics provide sufficient visibility to the**
13 **Department and stakeholders to perform such an assessment?**

14 **A** Unfortunately, they do not. The Company proposes to use the statewide metrics to
15 measure its progress on integrating DER, as well as measuring the total number of
16 DG customers and interconnected DG capacity by circuit and substation.⁸³ The
17 statewide metrics include the total number of grid-connected DG facilities, as well
18 as the nameplate capacity, estimated output, and technology type of each
19 resource.⁸⁴ Collectively, these metrics are a good start but do not provide a
20 comprehensive picture of the role of DER in Unitil's system over time. We
21 recommend additional metrics that will allow the Department and stakeholders to
22 assess the role of DER in Unitil's system, including:

23 1. The percentage of consumption that is satisfied by DER, by type of resource
24 and, ideally, by substation

⁸³ Unitil GMP, p. 96.

⁸⁴ *Id.*, p. 91.

- 1 2. The percentage of peak that is satisfied by DER, by type of resource and,
2 ideally, by substation
3 3. The rate of DER adoption among customers of different rate classes

4 **Q The DPU recognized that customer engagement is key to successful**
5 **modernization of the grid. Does Unutil’s GMP include a comprehensive**
6 **customer engagement plan, sufficient to enable customers to act as**
7 **empowered grid participants?**

8 **A**In part. The Company’s Marketing, Engagement, and Outreach plan focuses
9 primarily on customer education rather than on providing increased opportunities
10 for customers to actively participate on the grid. However, Unutil does place a
11 strong emphasis on transforming its role into that of a platform for third party
12 services.

13 **Q Does the Company’s MEO plan recognize the role of third parties in**
14 **empowering customer actions?**

15 **A**To some extent. The Company does identify third-party vendors as an important
16 part of the ecosystem of a modern grid, describing a vision of itself as a platform
17 for “enabling new and evolving services to customers rather than directly
18 providing them.”⁸⁵ To this end, Unutil proposes to ease entry of third parties to the
19 market through provision of aggregate, anonymized customer data⁸⁶ and use of a
20 standard format for downloads of individual customer data (for example, to
21 customer-facing apps, with customer permission).⁸⁷ However, provision of data is
22 not sufficient to create a robust market of third-party vendors. A shift in
23 incentives is necessary to create business opportunities for such service providers
24 and the Company proposes no such shifts. While the Department did not require
25 the Companies to explicitly contemplate such changes to the utility business

⁸⁵ *Id.*, p. 25.

⁸⁶ *Id.*, p. 89.

⁸⁷ *Id.*, p. 88.

1 model in their GMPs, we note that Unitil took the independent initiative to
2 propose changes to the way distributed generation is compensated as part of its
3 GMP.⁸⁸ The Company clearly felt it had the latitude to broach such subjects—it
4 simply chose to do so to the detriment of DER rather than to benefit of customers,
5 who benefit from a robust marketplace of services provided by third parties.

6 **Q Are the Company’s proposed metrics sufficient to enable the Department
7 and stakeholders to assess the Company’s progress in engaging customers?**

8 **A** Only in part. In addition to the statewide metrics, the Company proposes to
9 measure the number of customers using its web portal and mobile app as well as
10 the number of customers participating in time-varying rates.⁸⁹ The Company
11 should also report a measure of the frequency with which customers and third
12 parties access the proposed data infrastructure.⁹⁰

13 **Q The Department identified achievement of the Commonwealth’s policy goals
14 as one of the most important outcomes of grid modernization. Does the
15 Company’s GMP clearly set forth the extent to which these investments will
16 facilitate easier achievement of these goals?**

17 **A** No. Despite the Department’s explicit instruction to include a description of how
18 the Companies’ proposed investment plans impact state policy goals,⁹¹ Unitil
19 simply does not address this question.

20 **Q Please summarize your evaluation of Unitil’s GMP.**

21 **A** Of all three GMPs filed by the Commonwealth’s electric distribution companies,
22 Unitil’s is the most forward-thinking in terms of its emphasis on opening
23 opportunities for third-party involvement, customer engagement with data, and
24 repositioning the Company as a platform for further innovation. However, as we

⁸⁸ *Id.*, pp. 104-107.

⁸⁹ *Id.*, p. 96.

⁹⁰ Such measures could include metrics common in the technology industry such as monthly active users.

⁹¹ 12-76-C, p. 8.

1 discuss above, we have serious concerns with Unitil’s treatment of DER; we find
2 that the Company’s metrics provide insufficient visibility of its ability to further
3 integrate DER; and in general, we are concerned that the Company’s GMP does
4 not provide a clear commitment to outcomes that satisfy the Department’s
5 objectives for grid modernization and the Commonwealth’s policy goals for the
6 electricity system, nor does it serve as a roadmap to those outcomes. Ultimately,
7 we find that the Company’s GMP fails on the two fronts that are key to a grid
8 modernization plan: it does not sufficiently justify the level of investment
9 proposed in the plan, and it cannot serve as a guide to transformative
10 modernization of the grid.

11 **Q Given this evaluation, do you have recommendations to the Department**
12 **regarding the disposition of Unitil’s GMP?**

13 **A** Yes. First and foremost, we recommend that the Department decline to approve
14 spending based on the Company’s incomplete and insufficient GMP. Instead, we
15 recommend that the Department require a new GMP that can serve as a
16 comprehensive, forward-looking distribution system planning document—and
17 that is responsive to the Department’s goals and requirements for grid
18 modernization. This revised plan should include the following:

- 19 • An investigation and description of the Company’s distribution system
20 needs throughout the planning period, including both the need to satisfy
21 sales and peak demand at the system and substation levels, and the need
22 for modernization to enable use of a greater diversity of resources and,
23 ultimately, lower system costs;
- 24 • A clear and comprehensive description of the resources available to meet
25 distribution system needs and objectives throughout the planning period.
26 These resources should include all conventional distribution investments
27 as well as all potential DERs. Detailed forecasts of the costs, capabilities,

1 and availabilities of all resources should be key aspects of these
2 descriptions;

- 3 • A clear and comprehensive description of the resources that the Company
4 proposes to use to meet distribution system needs and objectives
5 throughout the planning period, with details regarding both conventional
6 distribution investments and DERs. These details should include the
7 expected capabilities or size of each resources—for example, expected
8 MWh of generation, MW of capacity, or MVA_r of compensation;
- 9 • A clear and comprehensive business case analysis of the key resources
10 that the Company proposes to use to meet distribution needs throughout
11 the planning period. This should include all relevant costs, benefits, and
12 qualitative factors considered in the business case, as well as a detailed
13 narrative justification of proposed investments;
- 14 • Forecasts of key system outcomes and indicators, for example DER
15 penetration rates, annual distribution system revenue requirements, annual
16 system CO₂ emission rates, and measures of customer and third-party
17 activity and engagement;
- 18 • A customer engagement plan, indicating how the Company will educate
19 customers, provide them with access to DERs, and otherwise provide
20 them with the means to optimize their consumption patterns.
- 21 • A third-party engagement plan, indicating what steps the Company will
22 take to encourage third-parties (including DER developers and customer
23 aggregators) to provide technologies and services to customers and to the
24 Company; including draft requests for proposals to procure non-wires
25 alternatives (NWAs) to conventional distribution investments.

26 In addition, we recommend that the Department require the Company to collect
27 additional metrics, as enumerated above. We further recommend that the

1 Department require these metrics to be published on a publicly-accessible web
2 dashboard for the benefit of stakeholders and the public and that the Department
3 establish standards for these metrics and a process for evaluating the Companies'
4 performance.

5 **Q Does this conclude your testimony regarding Unital's GMP?**

6 **A** It does.

7 **7. EVERSOURCE'S GMP**

8 **Q Please summarize the goals and approach of Eversource's GMP.**

9 **A** Eversource claims that the mission of its GMP is "to implement transformational
10 change through innovation and escalation."⁹² Eversource developed its GMP
11 using seven guiding principles, including, among other things, the Department's
12 four grid modernization objectives, a focus on customers and advancement in
13 customer education, and implementing cost-effective investments.

14 To fulfill this mission, Eversource proposes two principal components. The first is
15 its Grid Modernization Base Commitment (GMBC), which is presented in the
16 Company's concurrent base rate case proceeding, D.P.U. 17-05. The GMBC
17 addresses foundational investments needed to enable grid modernization
18 initiatives. The second is the Incremental Grid Modernization Plan (IGMP),
19 essentially its original GMP's STIP, which comprises the additional investments
20 proposed in the current proceeding to advance a more modern grid. Our testimony
21 only address the Company's IGMP; it does not discuss the GMBC at issue in the
22 Company's rate case proceeding.

23 Unlike the other two Companies, Eversource has essentially declined to respond
24 to the Department's directive to obtain advanced metering functionality in the
25 near term. Instead, its planned investments are essentially limited to those

⁹² Eversource IGMP, p. 6.

1 necessary to support an opt-in TVR program and accompanying marketing
2 campaign.

3 **Q Is Eversource's IGMP a roadmap to grid modernization? Does it serve as a**
4 **comprehensive planning document, suitable to guide a broad and**
5 **transformative modernization of the grid?**

6 **A** No. As discussed below, the Company's IGMP lacks a comprehensive description
7 of distribution system needs and the resources available to meet those needs, an
8 evaluation of those resources, or a well-justified proposal of a resource plan that
9 appropriately balances cost with other system considerations. Instead, the
10 Company has presented a plan to receive pre-approval for millions of dollars of
11 spending on investments that fail to comprehensively address the Department's
12 goals and requirements for grid modernization. These proposed investments are
13 supported by a justification that depends more on rhetoric than on a detailed
14 discussion of costs, outcomes, and alternatives
15 As we describe below, the Company's IGMP does not devote appropriate
16 attention and effort to the DPU's goal of furthering DER integration, provides a
17 thin and insufficient plan to engage customers (and third-parties interested in
18 providing enabling services to those customers) in a modernized grid, and
19 proposes to rely on a set of metrics that would not allow the DPU and
20 stakeholders adequate visibility of the Company's progress towards achieving a
21 broad transformation. Ultimately, we find that the Company's IGMP is not the
22 ambitious and comprehensive planning document requested by the Department,
23 fails to respond to the Department's explicit directives regarding modernization in
24 the near-term, and does not provide the Department with evidence sufficient to
25 justify significant spending on grid modernization investments.

1 **Q Does Eversource’s IGMP propose significant investments?**

2 **A** Yes. Despite its lukewarm approach to grid modernization, the Company’s
3 planned capital spending associated with its IGMP is estimated to cost \$138.2
4 million. This investment is designed to support customer engagement (opt-in
5 time-varying rates) and enabling technologies (cyber security and a customer
6 education and outreach plan). The Company proposes to recover these
7 investments through a new “GMP” factor in the Company’s Performance Based
8 Ratemaking Mechanism addressed in its base rate case proceeding. This recovery
9 mechanism would apply to all the Company’s grid modernization-related capital
10 spending above \$400 million; for spending below this amount the Company
11 proposes simply to recover its costs as part of an overall performance-based
12 ratemaking schema.⁹³ As we discuss below, Eversource’s IGMP fails to justify
13 these investments, either on the basis of demonstrable progress towards the
14 Department’s grid modernization investment or on that of system needs.

15 **Q Does Eversource’s IGMP discuss the Company’s distribution system**
16 **investment needs?**

17 **A** Yes, in part. Most of the Company’s original discussions regarding its distribution
18 system investment needs have shifted to its GMBC in its base rate case
19 proceeding. In its IGMP, Eversource focuses on distribution system investments
20 only as they relate to implementing its opt-in time-varying rate program,
21 including installation of more advanced meters, billing system upgrades, and data
22 management and storage software. Of the Company’s investment plan, \$104.8
23 million (76 percent) is related to meters and information technology system
24 upgrades to support time-varying rate structures.

⁹³ *Id.*, pp. 7-8, 12.

1 **Q How did Eversource select and justify the proposed investments?**

2 **A** Eversource’s description of how it selected its investments is lofty. The Company
3 states that its IGMP is “grounded on the grid modernization objectives identified
4 by the Department and supported by the Company” and that it developed its
5 “GMP vision by first identifying the key attributes that a grid modernization plan
6 should strive to achieve in the long term.”⁹⁴ Eversource also incorporated
7 stakeholder feedback into the development of its GMP.⁹⁵ While a focus on goals
8 and incorporating feedback from stakeholders are important first steps, the IGMP
9 does not describe the potential investments that were considered and rejected by
10 the Company, nor does it explain how the Company determined the appropriate
11 investment level for different technologies.

12 The Company’s IGMP is justified primarily on the basis of its business case cost-
13 benefit analysis. However, the Company’s analysis shows that the opt-in time-
14 varying rate program at the core of its IGMP is not cost-effective, with a benefit-
15 cost ratio of only 0.3.⁹⁶ Eversource provides no explanation for why it chose to
16 focus its IGMP on an opt-in time-varying rate design as compared to other
17 opportunities available for developing a modern grid, apart from including an
18 extensive critique of opt-out time-varying rates.⁹⁷

19 **Q Did Eversource clearly describe the expected outcomes of its proposed**
20 **investments and grid modernization plan?**

21 **A** No. Eversource claims that its IGMP will achieve multiple objectives and will
22 provide benefits to customers, yet provides no further evidence to support such
23 statements.⁹⁸ The Company’s simple mention of the outcomes and benefits of its

⁹⁴ *Id.*, p. 12.

⁹⁵ *Id.*, p. 69.

⁹⁶ *Id.*, p. 62.

⁹⁷ *Id.*, pp. 33-44.

⁹⁸ *Id.*, p. 14.

1 IGMP does not provide a clear or comprehensive picture of the anticipated
2 impacts on the Department’s grid modernization objectives.

3 Eversource expects that only five percent of customers will opt into its time-
4 varying rate program.⁹⁹ The Company is silent regarding the expected system
5 impacts of this level of adoption, presenting no forecast of whether peak savings
6 are expected to occur from customer participation in the time-varying rate
7 program and, if so, where and to what extent.

8 **Q Should the Department expect the Company to include a concrete discussion
9 of outcomes in its IGMP?**

10 **A** Yes, certainly. The Department clearly indicated that it wanted the Companies to
11 discuss the expected outcomes of their GMPs in a clear and concrete manner. The
12 Department repeatedly instructed the Companies to outline how they “propose to
13 make *measurable* progress” towards the achievement of the Department’s
14 objectives for grid modernization.¹⁰⁰ While the Company’s actual progress
15 towards these objectives should be visible to the Department and stakeholders
16 through the use of metrics, as discussed below, the inclusion of metrics does not
17 excuse the Company from demonstrating an expectation of such progress.

18 **Q Does Eversource’s IGMP comprehensively address how the proposed
19 investments will enable achievement of the DPU’s goals for grid
20 modernization?**

21 **A** No. The Company’s attempt to “demonstrate” how its investments will enable
22 achievement of the DPU’s goals for grid modernization consists of a table of its
23 investments with checkmarks for each of the Department’s goals.¹⁰¹ Even
24 according to this table, the core of Eversource’s IGMP—the opt-in time-varying

⁹⁹ *Id.*, p. 24.

¹⁰⁰ D.P.U. 12-76-B, p. 2.

¹⁰¹ Eversource IGMP, p. 65.

1 rate program—is cited as contributing solely to the goal of optimizing demand,
2 with no checkmarks for the other three objectives.

3 This deficiency is particularly pronounced with respect to the Department’s goal
4 of integrating DERs. The only mention of DERs in Eversource’s IGMP is as a
5 general goal unaccompanied by supporting investments or evidence, as a small
6 component of its marketing campaign veiled as a customer outreach program, and
7 as an area for potential improvement only *after* the five-year STIP provides more
8 information on DER integration.¹⁰² Eversource’s IGMP proposes no capital
9 improvements related to DER integration, and its operation and maintenance
10 efforts are limited to general education and assistance provided to customers
11 already looking to invest in DERs.

12 **Q What are the particular deficiencies of the plan with respect to integration of**
13 **DER?**

14 **A** There are two main deficiencies with respect to the Company’s treatment of DER
15 integration. First, the Company failed to consider and promote DER integration as
16 both a means to grid modernization and as an end thereof. Second, the Company
17 failed to demonstrate that its IGMP would actually lead to increased DER
18 integration, which is one of the Department’s primary goals for grid
19 modernization.

20 **Q Has the Company shown that its planned investments will enable integration**
21 **of DER?**

22 **A** No. DER and other “non-wires alternatives” are not among the technologies
23 considered by the Company to further the Department’s grid modernization goals.
24 We note here that the Department explicitly did not limit the scope of GMPs to
25 capital investments. Rather, the DPU clearly described the scope of GMPs to

¹⁰² *Id.*, p. 82.

1 include “all grid modernization planning and investments,” including but not
2 limited to the STIP.¹⁰³ Distributed generation, energy efficiency, demand
3 response, storage, and electric vehicles all fall within this scope and would be
4 expected to impact the Company’s needs and plans. While the Department did not
5 require a comprehensive alternatives analysis, we still find that the Company
6 erred in not considering or discussing the potential of DER integration to serve as
7 a means to achieving a modern grid.

8 **Q Outside of capital investments, will the Company’s planned implementation**
9 **of grid modernization promote DER integration?**

10 **A** No. The Company’s IGMP includes no quantitative evaluation of DER adoption
11 with and without implementation of the plan. Nor did the Company provide a
12 forecast of other distributed resources, such as storage and demand response.
13 Utilities routinely forecast DER adoption rates under different sets of
14 assumptions. As such, we see no reason as to why the Company could not
15 perform such an analysis with regards to the impacts of its IGMP.

16 **Q How can the Department and stakeholders assess the Company’s progress**
17 **towards achievement of the goal of integrating DER?**

18 **A** The Department clearly intends for newly-required metrics to provide visibility
19 into the Company’s actual future success in integrating DER, regardless of
20 whether a forecast is presented in the GMP.

21 **Q Do the Company’s proposed metrics provide sufficient visibility to the**
22 **Department and stakeholders to perform such an assessment?**

23 **A** Unfortunately, they do not. The Company has removed metrics to measure
24 progress on integrating DER from its IGMP; therefore, Eversource is not
25 proposing any metrics regarding integration of DERs.

¹⁰³ 12-76-B, p. 15.

1 We recommend that Eversource, at a minimum, adopt the statewide metrics
2 suggested by the Department and adopted by both National Grid and Unitil. These
3 metrics include the total number of grid-connected DG facilities, as well as the
4 nameplate capacity, estimated output, and technology type of each resource.¹⁰⁴
5 These metrics are a good start but do not provide a comprehensive picture of the
6 role of DER in the Company's system over time. We suggest additional metrics
7 that will allow the Department and stakeholders to assess the role of DER in
8 Eversource's system, including:

- 9 1. The percentage of consumption that is satisfied by DER, by type of resource
10 and, ideally, by substation
- 11 2. The percentage of peak that is satisfied by DER, by type of resource and,
12 ideally, by substation
- 13 3. The rate of DER adoption among customers of different rate classes

14 **Q The DPU recognized that customer engagement is key to successful**
15 **modernization of the grid. Does Eversource's IGMP include a comprehensive**
16 **customer engagement plan, sufficient to enable customers to act as**
17 **empowered grid participants?**

18 **A** No. The Company's customer engagement plan focuses primarily on customer
19 education rather than on providing increased opportunities for customers to
20 actively participate on the grid. Even the customer education components of the
21 Company's plan are lacking, as the majority of the Company's plan is a glorified
22 marketing scheme. Eversource proposes to educate customers through TV
23 commercials, radio advertisements, bill inserts, billboards, and social networking
24 investments. While it proposes limited community engagement efforts, the
25 Company's customer engagement plan relies primarily on unidirectional

¹⁰⁴ 12-76-B, p. 32.

1 communications and advertisements *from Eversource to* customers—interactions
2 that do not allow for interactive learning between the customer and the utility.¹⁰⁵

3 **Q Does the Company’s customer engagement plan recognize the role of third**
4 **parties in empowering customer actions?**

5 **A** No. The Company makes little to no reference to third parties throughout its entire
6 IGMP. Rather, the customer education and outreach plan is Eversource-centric,
7 with objectives such as “help customers who have or are considering DER to get
8 the information they need to make a decision or to manage their system from a
9 reliable, trustworthy, partner like Eversource.”¹⁰⁶

10 Third party vendors are an important part of the ecosystem of a modern grid.
11 Eversource should engage these market actors as allies in achieving the
12 Department’s grid modernization goals. A shift in incentives and market actors is
13 necessary to engage customers and develop a modern grid.

14 **Q Are the Company’s proposed metrics sufficient to enable the Department**
15 **and stakeholders to assess the Company’s progress in engaging customers?**

16 **A** No. The Company has removed any metrics relating to customer engagement
17 from its IGMP. The only metrics in the Company’s IGMP relate to optimizing
18 demand. At a minimum, the Company should report a measure of the frequency
19 with which customers access (or third parties access on customers’ behalf) grid
20 modernization touch points, as incorporated into Eversource’s IGMP and GMBC.

21 **Q The Department identified achievement of the Commonwealth’s policy goals**
22 **as one of the most important outcomes of grid modernization. Does the**

¹⁰⁵ Eversource IGMP., pp. 48-60.

¹⁰⁶ *Id.*, p. 50.

1 **Company’s IGMP clearly set forth the extent to which these investments will**
2 **facilitate easier achievement of these goals?**

3 **A** No. The Company has put little effort into demonstrating that its IGMP will
4 support the Commonwealth’s policy goals. Although the Department referred to
5 nine different relevant policies, the Company simply mentioned that its opt-in
6 time-varying rate program may lead to a reduction in total system costs and will
7 reduce carbon emissions consistent with the Global Warming Solutions Act.¹⁰⁷

8 The Company indicates that conservation effects from its time-varying rate
9 program are “highly speculative” and that it did not estimate benefits related to
10 energy consumption reduction associated with the Renewable Portfolio Standard
11 or Demand Reduction Induced Price Effects.¹⁰⁸ Given the lack of evidence
12 supporting its claims, we cannot agree that the Company has convincingly shown
13 its IGMP will substantively contribute to achievement of the Commonwealth’s
14 policy goals

15 **Q Please summarize your evaluation of Eversource’s IGMP.**

16 **A** Eversource’s IGMP is, in sum, an opt-in time-varying rate program—a modest
17 proposal for something that the Company could offer to customers independently
18 of this proceeding. It provides little more than that. By shifting the majority of its
19 original GMP to its base rate case proceeding, the Company has signaled that
20 most of its grid modernization efforts are baseline investments that the Company
21 should be making to improve reliability and are not germane to a grid
22 modernization plan. The elements remaining in its IGMP are weak attempts to
23 maintain some semblance of a GMP.

24 The Company’s IGMP fails to comprehensively discuss how its proposed
25 investments will satisfy system needs or contribute in a concrete way to
26 achievement of the Department’s goals for grid modernization. The Company’s

¹⁰⁷ *Id.*, p. 66.

¹⁰⁸ Eversource’s responses to AG-4-18, AG-4-19, and DPU-2-3.

1 proposal for customer engagement is modest at best and makes no attempt to open
2 opportunities for customers to play more prominent and active roles on the grid.
3 Integration of DER is completely lacking from the Company's IGMP.

4 Ultimately, we find that the Company's IGMP fails on the two fronts that are key
5 to a grid modernization plan: it does not sufficiently justify the level of
6 investment proposed in the plan, and it cannot serve as a guide to transformative
7 modernization of the grid.

8 **Q Given this evaluation, do you have recommendations to the Department**
9 **regarding the disposition of the Eversource's IGMP?**

10 **A** Yes. First and foremost, we recommend that the Department decline to approve
11 spending based on the Company's incomplete and insufficient Incremental Grid
12 Modernization Plan. Instead, we recommend that the Department require a new
13 GMP that can serve as a comprehensive, forward-looking distribution system
14 planning document—and that is responsive to the Department's goals and
15 requirements for grid modernization. This revised plan should include the
16 following:

- 17
- 18 • An investigation and description of the Company's distribution system
19 needs throughout the planning period, including both the need to satisfy
20 sales and peak demand at the system and substation levels, and the need
21 for modernization to enable use of a greater diversity of resources and,
ultimately, lower system costs;
 - 22 • A clear and comprehensive description of the resources available to meet
23 distribution system needs and objectives throughout the planning period.
24 These resources should include all conventional distribution investments
25 as well as all potential DERs. Detailed forecasts of the costs, capabilities,
26 and availabilities of all resources should be key aspects of these
27 descriptions;

- 1 • A clear and comprehensive description of the resources that the Company
2 proposes to use to meet distribution system needs and objectives
3 throughout the planning period, with details regarding both conventional
4 distribution investments and DERs. These details should include the
5 expected capabilities or size of each resources—for example, expected
6 MWh of generation, MW of capacity, or MVA_r of compensation;
- 7 • A clear and comprehensive business case analysis of the key resources
8 that the Company proposes to use to meet distribution needs throughout
9 the planning period. This should include all relevant costs, benefits, and
10 qualitative factors considered in the business case, as well as a detailed
11 narrative justification of proposed investments;
- 12 • Forecasts of key system outcomes and indicators, for example DER
13 penetration rates, annual distribution system revenue requirements, annual
14 system CO₂ emission rates, and measures of customer and third-party
15 activity and engagement;
- 16 • A customer engagement plan, indicating how the Company will educate
17 customers, provide them with access to DERs, and otherwise provide
18 them with the means to optimize their consumption patterns.
- 19 • A third-party engagement plan, indicating what steps the Company will
20 take to encourage third-parties (including DER developers and customer
21 aggregators) to provide technologies and services to customers and to the
22 Company; including draft requests for proposals to procure non-wires
23 alternatives (NWAs) to conventional distribution investments.

24 In addition, we recommend that the Department require the Company to collect
25 additional metrics, as enumerated above. We further recommend that the
26 Department require these metrics to be published on a publicly-accessible web
27 dashboard for the benefit of stakeholders and the public, and that the Department

1 establish standards for these metrics and a process for evaluating the Companies’
2 performance.

3 **Q Does this conclude your testimony regarding Eversource’s IGMP?**

4 **A It does.**
